Mercury as an Antisymphilitic in Ayurvedic Medicine

DOI 10.1515/asia-2015-1046

Abstract: In the sixteenth century, a new disease appeared in India. Described for the first time in the ayurvedic classic *Bhāvaprakāśa* by Bhāvamiśra, it was called *phiraṅgaroga*, “disease of the Franks”. Given the name and what we know from contemporary reports of European observers in India, this was very likely the correlate to the so-called “French disease” or “Morbus Gallicus”, i.e., syphilis. The *Bhāvaprakāśa* describes the symptoms and various stages of *phiraṅgaroga* and presents seven different cures. Five of these prescribe the use of mercury: Three recipes for the ingestion of mercury, one recipe for using mercury as a fumigant and one in which mercury is rubbed into the patient’s hands. In this chapter, I will discuss Bhāvamiśra’s representation of the disease and the therapies he proposes for it. I will in particular analyze the use of mercury in the anti-*phiraṅgaroga* medicines, contextualising them within the history of the use of mercury in ayurvedic medicine and exploring possible links with antisymphilitic therapies in European, Persian, Arabic and Chinese medicine.

Keywords: Ayurveda, mercury, calomel, syphilis, Indian medical literature

1 *Phiraṅgaroga*: The disease of the others

In the sixteenth century, a new disease appeared in India. First described in the ayurvedic classic *Bhāvaprakāśa* by Bhāvamiśra, it was called *phiraṅgaroga*.¹ The Sanskrit compound term *phiraṅgaroga* means the disease (*roga*) of the “Franks” (*phiraṅga*), an umbrella term for Europeans or simply foreigners that could also

¹ The *Bhāvaprakāśa* is one of six Indian medical works that are considered particularly authoritative in the ayurvedic tradition. These works, all written in Sanskrit, are divided into two sets of three: the so-called “great three” (*bṛhatṭrayī*) or “old three” (*vr̥ddhatṭrayī*) and the “small three” (*laghutṭrayī*). The “great three” are the *Carakasamhitā*, the *Suśrutasaṃhitā* and the *Aṣṭāṅgahṛdayasaṃhitā*, which were composed some time between the first and the seventh centuries CE, the “small three” are the *Mādhavanidāna* (eighth century CE), the *Śārṅgadharasaṃhitā* (thirteenth to fourteenth century CE) and the *Bhāvaprakāśa* (sixteenth century CE).

more specifically refer to the Portuguese, to Eurasians or to Luso-Asians.² From at least the nineteenth century, scholars translating the Sanskrit medical works or writing about them have assumed that *phiraṅgaroga*, the disease of the Franks, was the correlate to the so-called “French disease” or “Morbus Gallicus”, i.e., syphilis.³ This assumption was based on the name given to the disease, on the description of its symptoms, as well on the fact that European observers such as Ludovico di Varthema and Garcia da Orta thought they were witnessing syphilis in India in the sixteenth century.⁴ The description of this disease in the *Bhāvaprakāśa* contains the first specific mention of Europeans in Indian medical literature. It is also worth noting that Bhāvamiśra’s description of *phiraṅgaroga* may be the only reference to the disease in all of sixteenth-century Sanskrit literature. Even contemporary medical works (as far as we can identify them as belonging to the sixteenth century) do not mention it.⁵ However, in the seventeenth century, several medical works appeared that refer to *phiraṅgaroga*, some of them suggesting treatments. Among these are Trimallabhaṭṭa’s *Yogatarāṅgiṇī* (first half-to mid-seventeenth century), Bindu’s *Rasapaddhati* (possibly first half of seventeenth century), Mevārāmamiśra’s *Vaidyakaustubha* (mid-to late-seventeenth century), Rāvaṇapaṇḍita’s *Arkaprakāśa*, Prāṇanātha’s

² See Yule/Burnell (2000 [1903]: 352–354) on “*Firinghee*”.

³ By the modern biomedical definition, syphilis is a venereal disease caused by the spirochete bacterium *treponema pallidum*. Given that microorganisms as causative factors for diseases were not known until the nineteenth century and that *treponema pallidum* was only identified in 1905, we cannot know whether the disease described by Bhāvamiśra was in fact syphilis as we understand it today, just as the identification of the sets of symptoms described in European publications as “Morbus Gallicus” or “French disease”, later named “syphilis” by Girolamo Fracastoro in his play *Syphilis sive morbus gallicus* (1530), cannot be understood to exactly represent what we understand as syphilis today. Patients suffering from Morbus Gallicus (or *phiraṅgaroga*) may not have been infected with *treponema pallidum*, or else they may have, but some of their symptoms, seen as indicative of Morbus Gallicus, may have been due to other factors. The term *phiraṅgaroga* is found in many later ayurvedic works and seems to be used in the same way Bhāvamiśra employs it and in India today, syphilis is called *fīrangrog* in Hindi, pointing to a certain continuity in the identification (if not understanding) of the disease.

⁴ See, for example, di Varthema 1863: 274 and 156 (though one should note that the Indian name Varthema mentions for the “French disease” is “pua” and not *phiraṅgaroga*) and Garcia da Orta, who describes treating patients for syphilis in his *Colloquies* (da Orta 1987 [1913]: 379).

⁵ The *Basavarājīya* may be the exception to this rule, if we understand its description of *mehavraṇa* (Basavarājīya, chapter 9, Basavarāja 2005: 168) to correspond to Bhāvamiśra’s blister of external *phiraṅga*. Reddy (1936: 29) notes that the Indian chroniclers and biographers do not seem to have recorded anything on the subject and that Telegu literature of the Vijayanagara Court has not yielded any positive evidence. A thorough search of the vernacular literatures and records in Malayalam and Kanarese might, however, bring up more relevant data.

Rasapradīpa, and the Dhanvantari (an anonymous work, probably later than the Bhāvaprakāśa).⁶ Further works might be added to this list: many Sanskrit medical works cannot be authoritatively dated.

2 The disease

The Bhāvaprakāśa devotes a short chapter in its therapy section to *phiraṅgaroga* and its treatments.⁷ The chapter begins with an explanation for the name of the disease, namely that it refers to the disease's country of origin, "*phiraṅgadeśa*", the country of the Franks (and given the broad understanding of the term *phiraṅga* this could mean Europe, Portugal, or indeed those parts of India inhabited by the Portuguese, e.g. Goa and parts of the Malabar coast), as well as to the idea that the disease is contracted through contact with Franks and from sexual intercourse with their women (*phiraṅgiṇī*). The author Bhāvamiśra categorizes the disease as "*āgantu*", which may be translated as "exogenous" or perhaps as "invasive", since the disease entity enters into the body from outside. This is one of the classic disease categorizations already found in the oldest of the Sanskrit medical texts available to us, the Carakasamhitā (c. first century CE), which states that there are three kinds of disease: the internally caused (*nija*), the invasive (*āgantu*), and the mental (*mānasa*). Internal diseases arise out of the body's humours, mental disease is brought about through certain mental processes, while invasive diseases arise from outside influences such as poisons, fire or wounding.⁸ Outside influence may also encompass contagion,

⁶ The Yogatarāṅgiṇī only mentions *phiraṅga*, but does not discuss it as a separate disease category. See Meulenbeld 1999–2002: IIA, 318. For references to *phiraṅgaroga* in Bindu's Rasapaddhati, Mevārāmamiśra's Vaidyakaustubha, Rāvaṇapaṇḍita's Arkaprakāśa, Prāṇanātha's Rasapradīpa, and the anonymous Dhanvantari, see Meulenbeld 1999–2002, IIA, 644, 305, 468, 763, and 507, respectively.

⁷ The Bhāvaprakāśa is divided into three large sections, the *pūrvakhaṇḍa*, the *madhyakhaṇḍa* and the *uttarakhaṇḍa*. The chapter on *phiraṅgaroga* is located in the *madhyakhaṇḍa* (the middle section). It is the 59th of 71 chapters that describe particular diseases or disease categories and the appropriate therapies (Sanskrit: *cikitsā*) against them. *Phiraṅga* is part of a section dedicated to skin diseases (or diseases that manifest on the skin) and is placed between chapters on *visphoṭa* (~ small pox) and *masūrika* (~ chicken pox). The edition of the Bhāvaprakāśa by Srikantha Murthy (1998–2000) was used for this article.

⁸ Carakasamhitā Sūtrasthāna 11.45. See Dominik Wujastyk 2003: 31. The Carakasamhitā edition by Sharma (2003) was used for this article. The doctrine of the three humours wind (*vāta*), bile (*pitta*) and phlegm (*kapha*) is one of the key concepts in ayurvedic medicine, though the classical texts display some disparity in their definition of how the humours function. In the

i.e., disease caused by contact with persons afflicted with disease, and is particularly associated with skin disease, fever, consumption and eye diseases. This notion generally plays a minor role in ayurvedic nosology, but is already discussed in the *Suśrutasamhitā* (c. third century CE).⁹ Bhāvamiśra explains that since the disease entity comes from outside the person, complications of the humours are a secondary development, and must be recognized through their symptoms. He classifies three kinds, or perhaps three stages of *phiraṅgaroga*: External (*bāhya*), internal (*abhyantara*) and both external and internal (*bahirantarbhāva*). External *phiraṅgaroga* manifests “like *visphoṭa*”. *Visphoṭa* can refer to a whole disease category of vesicular disease, but in this instance probably simply means a boil or a blister.¹⁰ Bhāvamiśra explains that the boil is treated like an ulcer (*vraṇa*) once it has burst, that is, presumably with a dietary

seminal seventh-century treatise *Aṣṭāṅgahṛdayasamhitā*, they are defined as both necessary substances in the body that fundamentally sustain its functioning and as potential sources for the arising of disease. Disease may arise when there is an imbalance in the proportional quantity of the humours, i.e., a pathological predominance of one or two of the humours or conversely their pathological diminution; if one or several of the humours spread outside their normal pathways; or if one or several of them are hindered from flowing through their normal pathways. Mitigating a humour means to counteract its abnormal growth and thus avoiding its overflow from the area that is supposed to contain it, or to counteract its diminution and its decreased flow and functioning in the body. See *Aṣṭāṅgahṛdayasamhitā Sūtrasthāna* 11. The edition by Srikantha Murthy (1991–1995) was used for all passages of the *Aṣṭāṅgahṛdayasamhitā*.

9 See *Suśrutasamhitā Nidānasthāna* 5.33–34: “Skin disease, fever, consumption, oozing of the eyes, and diseases resulting from contact with a diseased person (*upasarga*) pass from person to person because of [the following]: sexual intercourse [with a diseased person], touching [a diseased person’s] body, breathing [near a diseased person], eating from a [diseased person’s vessel], sharing [a diseased person’s] bed or seat, or using a [diseased person’s] clothes, flowery garlands, or unguents.” (Zysk 2000: 88). The *Suśrutasamhitā* edition by Sharma (1999–2001) was consulted for this article.

10 In older works, *visphoṭa* is a subcategory of *kuṣṭha* (skin diseases and leprosy). See Jolly (1994 [1951]: 122 and 118) on *visphoṭa*, and *visphoṭa* as a subcategory of *kuṣṭha*, respectively. In the context of *kuṣṭha*, *visphoṭa* describes “dark red swellings with thinner skin” (Jolly 1994 [1951]: 118). In the Bhāvaprakāśa’s chapter on *visphoṭa*, it is described as being caused by aggravated humours that vitiate the blood, flesh and bones and then localise in the skin, giving rise to vesicles that may appear either in one part of the body or on the entire body. Depending on which humour is predominantly aggravated, the appearance of the vesicles and the accompanying symptoms differ. Bhāvamiśra counts eight different types of *visphoṭa*. Only one of these, the third category of *visphoṭa*, which is caused by the aggravated humour “phlegm” (*kapha*), causes no pain, which is the initial characteristic of external *phiraṅga* mentioned by Bhāvamiśra. However, a patient suffering from *kapha*-born *visphoṭa* would also experience vomiting, loss of taste and exhaustion, and the vesicles would itch. Since Bhāvamiśra makes note of painlessness, but not of itching or other symptoms, it seems to me that *visphoṭa* in the

regimen, a prescription of several herbal decoctions and the application of herbal pastes and poultices to the affected skin.¹¹ Bhāvamiśra considers this condition easy to cure. Internal *phiraṅga* is likened to a disease called *āmaṡāta*. Its symptoms are pain and swelling in the joints and it is considered difficult to cure.¹²

Bhāvamiśra next describes the complications, or late stages (*upadrava*) of *phiraṅga*: emaciation, loss of strength, decay of the nose, sluggish digestion, bone atrophy and bone curvature. He concludes his description of the disease by repeating that external *phiraṅga* is easy to cure if its onset is recent and if there are no complications and that internal *phiraṅga* is difficult to cure. However, the disease can no longer be cured if the patient is weakened from chronic internal and external *phiraṅga*, if he suffers from the above-mentioned complications, and if the disease has spread. This, Bhāvamiśra notes, is what the ancient sages say on the subject – an interesting statement, given that the Bhāvaprakāśa is the first of the ayurvedic works to mention the disease.

3 The treatments

Bhāvamiśra presents us with seven different cures for *phiraṅgaroga*. Five of these prescribe the use of mercury: three recipes for the ingestion of mercury, one recipe using mercury as a fumigant and one in which the patient rubs mercury into his hands. The predominance of mercury is unusual for the Bhāvaprakāśa. Out of 71 chapters in the therapy section, only fifteen prescribe mercury, usually placing one recipe for a medicine containing mercury or cinnabar at the end of a list of several herbal medicines. The chapter on *phiraṅgaroga* breaks Bhāvamiśra's general pattern, since mercurial medicines are given pride of place and also outnumber the non-mercurial remedies in it.

instance of external *phiraṅga* simply means a boil, or a blister, or perhaps even a broad rash with many vesicles, but probably not the specific disease category of *visphoṭa*.

11 On the classification and treatment of ulcers in ayurvedic medicine, see Jolly 1994 [1951]: 132–133.

12 Compare these symptoms with those that Bhāvamiśra lists for *āmaṡāta*: Pain all over the body, loss of taste, thirst, lassitude, feeling of heaviness in the body, fever, non-digestion of food, swelling of the limbs. The symptoms of advanced *āmaṡāta* include swelling and extreme pain in the joints (the pain is compared to the pain of scorpion bites), excessive salivation, having a bad taste in the mouth and polyuria. Complications include hardness of the abdomen, colics, insomnia, vomiting, dizziness, pain in the heart, constipation, and flatulence.

Bhāvamiśra's main (or at least first) recipe for treating *phiraṅgaroga* describes the ingestion of *rasakarpūra* ("mercury that is like camphor", i.e., a white powder). This was either mercurous chloride (calomel) or mercuric chloride (corrosive sublimate), or a mixture of both.¹³ Bhāvamiśra tells us that *rasakarpūra* was pronounced effective against *phiraṅga* by the physicians of old. In his first recipe, he describes how about 500 mg of *rasakarpūra* are encased in wheat flour. The resulting pill is then covered in ground cloves and is swallowed whole with some water. Afterwards, the patient may chew some betel leaves, but should avoid salty and sour foods, as well as greens. Patients are further advised not to exert themselves, to avoid exposure to heat and travel, and most of all, to refrain from sexual intercourse with women. The advice to abstain from salt is given for all treatments with mercury, while the avoidance of sour foods is advised in three of the mercurial therapies. The second recipe describes the making of *saptaśālivaṭika* (seven grain-of-rice pills). Here, mercury is mixed with catechu (*khadira*), pellitory root (*ākārakarabha*) and honey, and the patient takes a pill a day for seven days.¹⁴

The third mercurial cure for ingestion is quite complicated and involves making a paste of mercury, sulphur and catechu to which a number of herbs, namely Indian rose chestnut (also called cobra's saffron, or Ceylon ironwood), cardamom, cumin and caraway, bishop's weed, sandal, long pepper, bamboo,¹⁵ spikenard and bastard cinnamon, honey and ghee are added. The powder of this

¹³ The processing of mercury is described at some length in chapter seven of the *Bhāvaprakāśa's pūrvakhaṇḍa* (*dhātvādiśodhanamāraṇavidhiprakaraṇam* 146–199). The preparation of *rasakarpūra* is described in verses 182–190. Uday Chand Dutt called *rasakarpūra* "perchloride of mercury" or "corrosive sublimate", though he noted that the product available at medical markets at the time of his writing (in the 1870s) was not pure perchloride of mercury, but a mixture of calomel and corrosive sublimate. See Dutt 1877: 37. Dole/Paranjpe (2004: 141–144) define *rasakarpūra* as corrosive sublimate (HgCl_2), but explain that some recipes for *rasakarpūra* produce a mixture of corrosive sublimate and calomel, the latter's proper Sanskrit name being *rasapuṣpa*.

¹⁴ It should be noted that plant nomenclature and identification in Ayurveda is a difficult subject. There are some plant materials whose identity is fairly certain. However, in other cases, identification, while not entirely guesswork, is more tentative. See Dominik Wujastyk 2003: xxxv–xxxviii on the difficulties with the identification of ayurvedic plant materials and using international Latin taxonomies (which are also not always consistent). I have tried to use English vernacular names as far as possible for this chapter, orientating myself on entries in the Kew Royal Botanical Gardens Medicinal Plant Names Services (<http://www.kew.org/science-conservation/research-data/resources/medicinal-plant-names-services>) both for English and Latin names of plant names given in Sanskrit in the ayurvedic source texts.

¹⁵ Sanskrit: *vaṃsalocana*. Rather than the stem or shoot of the plant, this refers to a translucent white substance found the nodal joints of some species of bamboo, composed mainly of silica and water with traces of lime and potash.

concoction is used against ulcers. Bhāvamiśra also notes that there will be no swelling in the mouth with this medicine.

In the fourth mercurial cure, mercury is mixed with sulphur and rice and the mixture is formed into seven pills. These are used for fumigation, one a day for seven days. Bhāvamiśra does not specify whether the vapours of the pills are to be inhaled or whether the affected parts of the body are to be fumigated. The latter is a standard ayurvedic procedure in skin diseases.¹⁶ However, the text says “one should apply smoke” (*dhūmaṃ prayojayet*), which implies the inhalation of smoke, as the Sanskrit technical term for the fumigation of the body is *dhūpana*.¹⁷

The last mercurial recipe prescribes rubbing mercury and the juice of the leaves of yellow-flowering country mallow (*pītapuṣpabalā*) into one’s hands until they are absorbed by the skin.¹⁸ The hands are then heated and made to sweat.

Two further cures involve the use of herbal substances, one being composed of plant materials standardly used in ayurvedic formulations (neem leaves, the emblic and chebulic myrobalans, and turmeric), the other consisting of a foreign plant: *cobacīnī*, or China wood (more commonly known as China root), the powder of which is to be taken with honey. Bhāvamiśra advises to avoid salt during treatment with China root, or to partake only of small quantities of rock salt. The chapter ends with Bhāvamiśra promising a complete and speedy cure through the mentioned remedies.

4 Categories of disease: *phiraṅgaroga* and syphilis

From the summary of the chapter above, it should be clear that its contents cannot be understood in isolation, but as part of the larger context of the treatise. The fundamental principles of Ayurveda, its particular understanding of the body, methodology of diagnosis and treatment, etc., implicitly form the basis of any disease categorization and the treatments prescribed. Each chapter of the Bhāvaprakāśa is linked at various points with other parts of the treatise. In the chapter on *phiraṅgaroga*, there are a number of explicit connections to other sections in the work (and to a wider ayurvedic knowledge), such as the reference

¹⁶ See Dutt 1877: 21 on the procedure of fumigation in skin diseases.

¹⁷ See Jolly 1994 [1951]: 34 on the difference between *dhūma*/*dhūmapāna* and *dhūpana*.

¹⁸ See Dutt 1877: 37 on *pītapuṣpabalā* as *Sida cordifolia* L.

to *visphoṭa* to describe the symptoms of external *phiraṅga*, or to *āmaṇāta* for those of internal *phiraṅga*, as well as the prescription to treat the boil of external *phiraṅga* like an ulcer (*vraṇa*) after it has burst. There are also other sections in the Bhāvaprakāśa that mention syphilis and treatments against it. For example, a chapter in the *pūrvakhaṇḍa* (the first part of the Bhāvaprakāśa) on the processing of mercury contains a detailed description of how to produce *rasakarpūra*.¹⁹ The passage gives an alternative recipe against *phiraṅga*, in which *rasakarpūra* is mixed with cloves, sandalwood, saffron and musk. In the glossary (*nighaṇṭu*) section of the *pūrvakhaṇḍa*, China root is discussed under its alternative name *dvipāntaravacā* (“mallow from another country”). Here, China root is prescribed for a range of complaints. It is defined as an effective medicine against any disease caused by the humour “wind” (*vāta*), epilepsy, insanity and bodyaches, as well as *phiraṅga*.²⁰ However, the treatise does not necessarily furnish one with all the knowledge needed to make sense of each section of it. Much is left unexpressed and remains the domain of the expert knowledge of teachers or the individual experience of a physician. Note, for example, that while Bhāvamiśra describes seven different cures, he does not indicate in what relation the cures stand to each other, i.e., are they all to be used, or just one? Should one remedy be favoured over the other? Should they be used at different times? What are the paradigms of choice?

Principles that are relevant to knowing which medical compound to use may be found in the glossary section in which plant or other materials are defined as having certain properties that make them suitable or unsuitable for persons with particular bodily or mental constitutions (*prakṛti*). This might help to decide which medicines to favour and which ones not to use for a particular patient. However, such principles can not tell us whether the multiple medicines might be used at different times or for the different stages of the disease. Bhāvamiśra does not overtly set the cures into relation with his proposed division of the disease into internal, external, internal/external and complications, raising the question of the point of discussing this division in the first place. However, one of the remedies is described as targeting particular symptoms: the third mercurial cure heals ulcers. This points to the possibility that the various cures could be used for the different stages of syphilis and their symptoms. The ayurvedic physician Uday Chand Dutt, who was writing in the late nineteenth century in Bengal, stated that the seven grain-of-rice pills were used in primary syphilis.²¹ He also noted that the

¹⁹ See *pūrvakhaṇḍa*, *dhātvādiśodhanamāraṇavidhiprakaraṇa*, 181–189.

²⁰ Bhāvaprakāśa *pūrvakhaṇḍa haritakyādivarga* 107–108.

²¹ Dutt 1877: 36–37.

alternative recipe with *rasakarpūra* (with cloves, saffron, sandal and musk) was used in secondary syphilis. And Thomas Wise, who wrote in the first half of the nineteenth century, mentioned that China root was to be used after completing mercurial therapy.²² The problem is that Dutt (and also Wise) wrote some 300 years after Bhāvamiśra and it is difficult to know how closely their commentaries of Bhāvamiśra's text represent the latter's intention. It is possible that Dutt's explanation of the more specific use of syphilitic medicines is the result of a lineage of knowledge transfer from teacher to pupil that goes back to Bhāvamiśra's times and faithfully reflects Bhāvamiśra's original method of treatment. However, it is also possible that Bhāvamiśra intended no such division in the choice of medicines and that Dutt simply reinterpreted Bhāvamiśra's text based on a modern understanding of the disease. After all, Dutt notably did not make use of Bhāvamiśra's categorization of internal or external *phiraṅga*, but drew on the contemporary categories of primary, secondary and tertiary stages of syphilis.

The division into three stages was first proposed by Philip Ricord in the middle of the nineteenth century, and was the standard theory in modern medicine at the time Dutt was writing.²³ Today, syphilis is divided in four stages: primary, secondary, latent and tertiary and is also understood to occur as a congenital disorder.²⁴

Bhāvamiśra's division of internal, external and internal/external syphilis does not quite match descriptions of the symptoms of the three stages of syphilis (following the nineteenth-century understanding of syphilitic presentation). However, the ulcer of external *phiraṅga* may correspond to the chancre of primary syphilis, and several of the symptoms of internal *phiraṅga* (pain, loss of taste, lassitude, fever, and a swelling of the limbs) are symptoms of both primary and secondary syphilis. Some of the symptoms that Bhāvamiśra describes as the complications of *phiraṅga*, decay of the nose, bone atrophy and bone curvature, are now considered symptoms of congenital syphilis, but were described as general symptoms of syphilis in European sources in the sixteenth century.²⁵ Thomas Wise, presumably interpreting the reference to *visphoṭa* as denoting a rash rather than a single boil, thought that Bhāvamiśra only described the symptoms of secondary syphilis. Wise included "affections of

²² Wise 1845: 378

²³ Ricord's theory was published in notes in the third edition of John Hunter's *A treatise on the venereal disease* (1853).

²⁴ See Marr 2007: 302–309 for a detailed description of the stages of syphilis and treatment.

²⁵ See Pusey 1933: 34–41 on symptoms ascribed to syphilis in the sixteenth century.

the bones, particularly those of the nose and palate” among the symptoms of secondary syphilis.²⁶

5 Ancient or new? Mercury as an antisyphilitic

As we have seen, Bhāvamiśra’s main therapies against syphilis consist in the administration of mercury, using it both internally and externally. Five out of seven of the treatments he describes involve the use of mercury, breaking his general pattern of favouring non-mercurial medicines over mercurial ones. This is not a minor difference: One must consider that out of seventy-one chapters of the therapy section, only fifteen give recipes containing mercury at all, usually placing one recipe for a medicine containing mercury or cinnabar at the end of a list of several herbal or mineral medicines. It should be emphasized that in no other chapter in the Bhāvaprakāśa do we encounter more mercurial remedies than non-mercurial ones. Furthermore, a closer look at the treatments in question reveals the recipes and the methods of their application to be highly unusual, both when compared with mercurial treatments in the Bhāvaprakāśa and with mercury therapies in other ayurvedic works. In the following, I will examine whether Bhāvamiśra’s seemingly unorthodox choice of therapies reflects an outside, possibly European, influence or whether the remedies can be understood as derivations of older ayurvedic practices.

5.1 Mercury in Indian medicine

The use of mercury in medicine has a long tradition in India, with first (albeit contested) references to mercury appearing in the oldest of the classical Sanskrit medical texts known to us, the Carakasamhitā and the Suśrutasamhitā (c. first and third century CE, respectively).²⁷

There is more certainty about the use of mercurial recipes in later works, notably in the Aṣṭāṅgahrdayasamhitā and the Aṣṭāṅgasamgraha, both c. seventh century CE. In these works we find various recipes for mercury treatments, both for topical and internal use.²⁸ The Jain medical treatise Kalyāṇakāraka (c. ninth

²⁶ See Wise 1845: 377–378.

²⁷ See Wujastyk 2013 for details on the possible occurrence of mercury in the Carakasamhitā and the Suśrutasamhitā.

²⁸ See Aṣṭāṅgahrdayasamhitā Uttarasthāna.13.36 and Aṣṭāṅgasamgraha Uttarasthāna.49.392 for a prescription of a medicinal paste for the treatment of the eye disease *timira*,

century CE) by Ugrāditya is the earliest medical text to describe procedures for purifying (*śodhana*) and calcining mercury (*māraṇa*, i.e., the calcination of mercury which makes it fit for pharmaceutical application).²⁹ If its dating to the ninth century is correct, its descriptions of mercury processing are among the earliest in Sanskrit literature available to us at present.

Further works with some mercurial recipes include the Siddhayoga³⁰ by Vṛnda (ninth or tenth century), which prescribes an ointment against lice that contains mercury and the Cakradatta or Cikitsāsāmaṅgraha by Cakrapāṇidatta (eleventh century), which gives about nine recipes for mercurial medicines, all for internal use. The Cakradatta also describes simple procedures for purifying mercury which involve macerating mercury with the juice of a number of plants in one case, and rubbing it with copper and steam heating it in sour gruel in another case.³¹ Vaṅgasena, who wrote the Cikitsāsārasaṅgraha in around the eleventh or twelfth century, presents quite a few recipes with mercury as an ingredient.³² He mentions mercury together with the technical terms *vimūrchita* (solidified), *mūrchana* (solidifying), and *śuddha* (purified).³³ And in a recipe for *tāmrarasāyana* (a tonic based on copper), Vaṅgasena describes how mercury is washed with a decoction of the three pungent substances (black pepper, long pepper and dried ginger) and sublimated and then rubbed with sulphur for three days. He refers to the resulting mercurial product as *mṛtasūtaka*, i.e. “killed mercury”.³⁴

In the thirteenth century, the Śārṅgadharasaṁhitā presents an elaborately formulated system of processing and using mercury. Its long chapter on mercury contains one quite complicated recipe for the purification of mercury (*rasaśodhana*), one recipe for purifying sulphur (*gandhakaśodhana*), two recipes for extracting mercury from cinnabar (*daradaśodhana*), four recipes for giving mercury a “mouth” to “devour” other metals, i.e., to absorb them, four recipes for the “killing”, i.e., making into ash of mercury, and nearly fifty recipes for

Aṣṭāṅgaḥṛdayasaṁhitā Uttarasthāna.32.31 for a recipe for a topical cream against freckles, and Aṣṭāṅgaḥṛdayasaṁhitā Uttarasthāna.39.161 for a rejuvenatory tonic, the first ayurvedic recipe for the internal use of mercury. The edition of the Aṣṭāṅgasamgraha by Srikantha Murthy (1995/1997) was used for this article.

medicines prepared from the above products. Most ayurvedic treatises written after the Śārṅgadharasaṃhitā incorporate sections on the processing of mercury or prescribe recipes which contain processed mercurial products.

5.2 Mercury as an antisyphilitic in Indian medicine

Phiraṅgaroga was not known to the author of the Śārṅgadharasaṃhitā, and none of the five mercurial recipes or treatment methods that Bhāvamiśra prescribes against *phiraṅgaroga* are found in the earlier work. As a reminder: Bhāvamiśra's main recipe describes the ingestion of *rasakarpūra* (calomel or corrosive sublimate), about 500 mg of which are encased in wheat flour and made into a pill, which is then covered in ground cloves and swallowed whole with some water. The second recipe describes the making of *saptaśāliṇaṭika* (seven grain-of-rice pills). Here, mercury is mixed with catechu, pellitory root and honey, and the patient takes a pill a day for seven days. In the third mercurial cure for ingestion a paste of mercury, sulphur and catechu is made to which a number of herbs, honey and ghee are added. In the fourth mercurial cure, mercury is mixed with sulphur and rice and the mixture is formed into seven pills. These are used for fumigation, one a day for seven days. The last mercurial recipe prescribes rubbing mercury and the juice of the leaves of yellow-flowering country mallow into one's hands until they are absorbed by the skin. The hands are then heated and made to sweat.

In the Śārṅgadharasaṃhitā, mercury is ingested mixed with honey or ghee, as a beverage, or in the form of pills (but not made from wheat and clove powder, or catechu, pellitory and honey). It is also applied as an eye ointment, smeared into the nose, rubbed into a small incision in the skin or used topically on areas of the skin affected by skin disease.³⁵ Śārṅgadharma does not describe rubbing mercury into the hands and then heating the hands, or preparing mercury pills for fumigation. *Rasakarpūra* is also not mentioned, though Śārṅgadharma suggests four different methods of producing ash of mercury.³⁶ These do not correlate with Bhāvamiśra's instructions for making *rasakarpūra*: His recipe specifies that purified mercury should be mixed with equal parts of red ochre, brick dust, chalk, alum, rock salt, earth from an ant-hill, sodium

³⁵ Eye ointment: Śārṅgadharasaṃhitā 2.12.135, smeared into the nose: Śārṅgadharasaṃhitā 2.12.136, rubbed into a small incision in the skin: Śārṅgadharasaṃhitā 2.12.121–126, used topically on areas of the skin affected by skin disease: Śārṅgadharasaṃhitā 2.12.190–193. The edition of the Śārṅgadharasaṃhitā by Srikantha Murthy (1984) was used for this article.

³⁶ See Śārṅgadharasaṃhitā 2.12. 29–34, 35–38, 38–40 and 41–42.

sulphate, and red earth (usually used for colouring pots).³⁷ The mixture is strained through cloth and placed in an earthen pot, which is covered with another pot mouth to mouth. The pots are luted together with clay and cloth and then placed on a fire and heated for four days. After they are opened, the white camphor-like deposit in the upper pot is collected for use.³⁸ Incidentally, this description of its production method and the recipe for a *rasakarpūra* pill in the *phiraṅgaroga* chapter are the only instances in which *rasakarpūra* is mentioned in the *Bhāvaprakāśa*.

If we accept the notion that alchemical and medical works represent two distinct, though overlapping traditions, *Bhāvamiśra*'s recipe for *rasakarpūra* is either the earliest or among the earliest in Sanskrit medical literature. However, a recipe for making calomel (no Sanskrit name is given for the product) already occurs in the *Rasārṇava*, an important alchemical treatise dated to about the tenth or eleventh century.³⁹ The alchemical treatise *Rasendrasārasaṃgraha* by *Gopālakṛṣṇā* (c. late fifteenth/sixteenth century CE?) has a recipe for obtaining white ash (*śvetabhāsmān*) of mercury.⁴⁰ Its production method differs in that the ingredients (mercury, salt and the juice of *Euphorbia neriifolia* L.) are placed in an iron bottle for heating.⁴¹

A further alchemical work, the *Rasendracintāmaṇi* (thirteenth/fourteenth century) gives another detailed recipe, which contains several of the same ingredients as *Bhāvamiśra*'s, namely brick-dust, alum and salt, and it calls the product *karpūra*, defining it as a remedy against all diseases (*sarvarogaharī*).⁴² *Bhāvamiśra* quotes from the *Rasendracintāmaṇi* a number of times, so it is quite

³⁷ See *Bhāvaprakāśa pūrvakhaṇḍa dhātvādisodhanamāraṇavidhiprakaraṇa* 182–190.

³⁸ See Dutt 1877: 29.

³⁹ The recipe is found in *Rasārṇava* 11.24. according to Ray 1903: 250: “Green-vitriol, alum, salt, borax, mixed with the aforesaid vegetable drugs, (vide original text) kill mercury in an instant (in the shape of calomel).”

⁴⁰ This recipe is found in 1.73–75 according to Meulenbeld 1999–2002: IIA, 730, who also notes that this work might be rather later than the estimated late fifteenth or sixteenth century.

⁴¹ “Rub mercury repeatedly with pāṃsu salt and the juice of *Euphorbia neriifolia*; place the mixture inside an iron bottle, the mouth of which is closed with a piece of chalk. The bottle is embedded in a mass of salt and then fire is urged for an entire day. The white deposit in the neck of the bottle is to be collected.” See Ray 1903: 252.

⁴² “I am now going to explain the process of preparing *rasakarpura*, which is a remedy for all diseases: take a strong earthen pot and fill one-fourth of it with common salt and place over it a mixture of brick-dust, alum and rock-salt. Rub mercury with the juice of Indian aloe and an equal weight of the above mixture into a paste; deposit it in the earthen pot and cover it with the same ingredients. The pot is to be firmly closed with a well-fitting lid. Now apply heat for three days together.” See Ray 1903: 251. The dating of this work to the thirteenth or fourteenth century follows Ray 1903: 251. According to Meulenbeld 1999–2002: IIA, 705, the

possible that his recipe for making *rasakarpūra* is derived from this work.⁴³ Ray pointed out that both the recipe of Rasendracintāmaṇi and of the Bhāvaprakāśa seem to have an analogue in a Chinese method for preparing calomel, in which alum and salt were used.⁴⁴ According to Meulenbeld, *rasakarpūra* is also mentioned in Nīlakaṇṭha's Basavarājīya.⁴⁵ This medical work might be a little earlier than the Bhāvaprakāśa, but its dating is uncertain.⁴⁶ Another, broadly contemporaneous work to mention *rasakarpūra* is the alchemical treatise Rasamañjarī by Śālinātha. The earliest manuscript of this text was completed in 1546/47 CE, which means that the work is earlier than the middle of the sixteenth century, possibly as early as the last quarter of the fifteenth century.⁴⁷ We also find *rasakarpūra* mentioned in Harṣakīrti's Yogacintāmaṇi, a medical work that was probably written some decades after the Bhāvaprakāśa. Harṣakīrti prescribed *rasakarpūra* against *āmavāta*, the symptoms of which Bhāvamiśra pronounced similar to those of internal *phiraṅga*.

In short, *rasakarpūra* is not an ancient mercurial product as was implied by Bhāvamiśra's remark in *madhyakhaṇḍa* 59.10 ("The *ancient physicians* said that the mercury known as "camphor" truly destroys the disease known as *phiraṅga*."), but was probably first used in India around the tenth or eleventh century (though it was not yet called *rasakarpūra* at that time) and received its name in the late fifteenth or early sixteenth century. One might argue that while the older recipes might have produced the same or a very similar product, the authors of these recipes may not have understood this product to be the same thing as the product of the others' recipes. However, it seems likely that, once they used the name *rasakarpūra*, they did think this was the same substance, even if the variations in ingredients and production methods might in fact have led to different products (with varying parts of calomel and parts of corrosive

Rasendracintāmaṇi dates to between the middle of the fifteenth century and the second half of the sixteenth century.

⁴³ Meulenbeld 1999–2002: IIA, 241 lists several passages in the Bhāvaprakāśa that mention the Rasendracintāmaṇi as their source.

⁴⁴ Ray 1903: 254–256.

⁴⁵ Meulenbeld 1999–2002: IIA, 461.

⁴⁶ Meulenbeld 1999–2002: IIA, 461 argues that "the developed state of *nāḍīparīkṣā* and *rasaśāstra* [i.e., pulse examination and alchemy], (...) indicate that it cannot be earlier than the fourteenth century. The prescription of *rasakarpūra*, although not yet against *phiraṅgaroga*, points to the sixteenth century as the period of its composition. This is confirmed by the presence of China root in the prescriptions against venereal diseases." Unfortunately, Meulenbeld does not provide a reference for the location of *rasakarpūra* in the Basavarājīya.

⁴⁷ Meulenbeld 1999–2002: IIA, 638.

sublimate, for example).⁴⁸ In any case, it seems safe to state that while *rasakarpūra* was a relatively late addition to the ayurvedic pharmacopoeia, its use preceded the arrival of the Portuguese in India. But can we perhaps connect the specific application of *rasakarpūra* against syphilis to the Portuguese, or to other Europeans who were present on the Indian subcontinent in the early to mid-sixteenth century? And what about Bhāvamiśra's other prescriptions, i.e., fumigation with mercury, or rubbing mercury into one's hands?

5.3 Similarities and differences in European and Indian anti-syphilitic mercury therapies

In the first half of the sixteenth century in Europe, no single universally accepted treatment existed for treating syphilis. Mercurial treatments against syphilis consisted of three main methods: Smearing mercurial salves onto the patient's body, washing the body in baths with added sublimated mercury (i.e. corrosive sublimate), or fumigating the patient's body.⁴⁹ In severe cases (i.e., when the former treatments showed no result), mercury fumes were inhaled directly. However, mercury preparations were also ingested from quite early on in the sixteenth century, the perhaps most famous preparation for internal use being Paracelsus' *Turpethum minerale*.⁵⁰ Mercurial salves, such as the famous *unguentum saracenicum*, had been used in Europe against skin diseases since the late Middle Ages. While the specific recipe for this ointment does not correlate with any known recipe for ointments in Arabic medicine, as Bachour points out in this volume, the topical use of mercury against skin disease is well documented in Arabic medicine and is likely to have been the basis for the

⁴⁸ See Ray 1903: 250–261, esp. 260–261 for a summary of a series of experiments following the recipes laid out in the *Bhāvaprakāśa*, *Rasendracintāmaṇi*, etc. Ray concluded that the *Bhāvaprakāśa*'s recipe led to the production of a mixture of calomel and corrosive sublimate, due to the brick-dust. An alternative recipe without brick-dust produced pure calomel.

⁴⁹ See Lesky 1959: 3174 and 3179–3180 on the use of mercury ointments in medieval Europe and on fumigation therapy and on baths with mercury salts, respectively. Also see Girtanner 1797: 303 for a reference to the earliest medical writers to endorse fumigation with mercury: Cataneus (1505), Bologninus (1507), Joh. Benedictus (1508) and Johann de Vigo (1513).

⁵⁰ According to Girtanner (1797: 334), Johann de Vigo, personal physician to Pope Julius II, was among the first to prescribe pills of red precipitate of mercury for internal use. However, Girtanner's assertion cannot be confirmed. Rather, it seems that this preparation was only used topically by de Vigo to treat venereal ulcers. I would like to thank Dr. Natalia Bachour for pointing this out to me.

European use of mercury ointments⁵¹: For example, the famous eleventh-century Persian physician and philosopher Ibn Sīnā (Avicenna), whose *Canon of medicine* was hugely influential in European scholarly medicine, proposed the topical use of mercury against various skin diseases, though he warned against the internal use of mercury.

The toxicity of mercury was known, if not clearly understood, and physicians were very concerned with harnessing what they presumed to be the curative powers of mercury while keeping the side effects in check. This problem was tackled in three ways. First, by reducing the actual amount of mercury in mercurial remedies, trying to arrive at an amount that was both safe and effective. Second, by adopting methods developed in Arabic medicine of “extinguishing” (*extinctio*) or “killing” (*mortificatio*) mercury by mixing it with various substances (for example, with oil, lard, vinegar, or even saliva). Third, by adding further substances, such as lead, sulphur, arsenic, myrrh, frankincense and other herbal or mineral substances to the mix. These were meant to counteract or balance the characteristics of mercury which were seen as the root cause of its negative effects.

These negative effects could be dramatic, easily equalling the ravages of syphilis. The symptoms of intoxication included ulcerations of the jaws, loosening of the teeth, swelling of the tongue, lips and palate, salivation, and fetid breath. The overuse of mercury and particularly the inhalation of mercury fumes could (and apparently often did) kill the patient. So painful and difficult to bear were these mercury therapies that patients and physicians alike were desperate to find other cures. This partly explains the popularity of alternative remedies, such as the cure with guaiacum, or with China root.⁵²

To return to the question whether we can relate Bhāvamiśra’s depiction of antisyphilitic (or anti-*phiraṅga*) treatment with mercury to European methods of mercurial therapy, we can broadly point to some major differences. For example, Bhāvamiśra does not describe the making of a mercurial ointment for topical use. The one example of a topical use of mercury use is the recipe in which mercury is rubbed with the juice of the leaves of yellow-flowering country mallow into the patient’s hands until they are absorbed by the skin. While one

⁵¹ On the problem of defining medicine in the medieval Islamic world as “Arabic”, “Persian”, “Islamic”, “Greco-Arabic”, etc., see Pormann/Savage-Smith 2007, especially the chapter “The emergence of Islamic medicine”. For simplicity’s sake, I adopt “Arabic medicine” here, keeping in mind the complexity of the situation of medical writing in the medieval Islamic world, where medical writers could hail from different regions, write in Arabic or Persian, and belong to different religious (also non-Islamic) groups, but would still be considered part of an intellectual continuum.

⁵² On the history of the use of China root, see Winterbottom 2014 and Wujastyk in preparation.

might argue that a mix of mercury with the plant juice constitutes a kind of ointment, this is a very simple prescription when compared to the multi-component ointments used in European medicine. Then, the topical use is restricted to the hands, the rest of the body is not anointed. There is at least one example of a European prescription to anoint the hands: The thirteenth-century Byzantine physician Nicholas Myrepsos (or Nicolaus Myrepsus) seems to have prescribed rubbing a salve containing lead and mercury that had been warmed on a fire onto the hands and feet in his *Dynameron* (a large and very important compilation of Byzantine pharmaceutical recipes).⁵³ However, this prescription predated the occurrence of syphilis in Europe by more than two centuries and does not seem to have influenced antisyphilitic treatment methodology.

An important similarity between the Indian and European methods lies in the use of heat to aid the absorption of the mercury into the skin, though no special apparatus seems to have been used in the Indian case. Heating parts or, more typically, all of the body and inducing sweating is very much part of classical ayurvedic treatment.⁵⁴ However, heating one particular part of the body (for example, by using hot poultices) is usually meant to tackle a problem in that area. It is difficult to explain the hands as the locus of treatment, both for the absorption of the medicine and for the expulsion of matter (sweat) from the body, and I do not know of a corresponding treatment either with or without mercury in the ayurvedic works. In sum, this is a curious remedy that can neither be clearly identified as relating to European methods of treatment nor fully explained as a derivation from ayurvedic standard treatments.

By contrast, fumigation (with other medicinal substances) as a therapeutic method is already recorded in the earliest ayurvedic works, so that fumigation with mercury could be seen as a simple derivation from an older idea.⁵⁵ Bhāvamiśra's description leaves doubt as to whether the body should be fumigated or whether the fumes of the mercury pills should be inhaled. Either possibility has precedents in ayurvedic medicine (albeit not with mercury), and also occurs in European medicine. A connecting point between Bhāvamiśra's fumigation therapy and European methods lies in the mercurial substance used for producing the fumes. In Europe, this was typically cinnabar. Bhāvamiśra's recipe prescribes that liquid mercury is mixed with sulphur and

⁵³ See Almkvist 1928: 181.

⁵⁴ On ayurvedic sweating therapies, see Jolly 1994 [1951]: 34.

⁵⁵ See Jolly 1994 [1951] 34 on *dhūma* and *dhūmapāna* (fumigations in the nose or mouth) and *dhūpana* (the local application of smoke through a pipe in ulcers and skin diseases). Also see Dutt 1877: 21 on the procedure of fumigation in skin diseases.

rice into a paste called *kajjalī*, black sulfide of mercury (HgS), i.e., black cinnabar. Both cinnabar (Sanskrit: *darada*, *hiṅgula*) and black sulfide of mercury feature largely in ayurvedic mercurial remedies. For example, most of the recipes in the thirteenth-century Śārṅgadharasamhitā for mercurial medicines are based on a mixture of mercury and sulphur.⁵⁶ However, to my knowledge, there is no ayurvedic precedent for using mercury (with or without sulphur) for making pills for fumigation, and this is also the only instance in which mercury is used as a fumigant in any of Bhāvamiśra's formulations.⁵⁷

For this reason, the possibility that fumigation with mercury as an antisyphilitic therapy was introduced to India by Europeans – for whom fumigation with mercury was, after all, a very standard therapy – cannot be discounted, though one would also need to consider whether it might have been adopted from Chinese or Persian medicine or already occurred in early Indian alchemical works. As Johannes Thomann shows in this volume, fumigation with mercury is described in one of the early Persian works to deal with syphilis, the *Ġāmi al-fawā* (“Collection of notices”) of Yūsufī, which was written in 1511. Natalia Bachour points out that the first European physicians to prescribe fumigation therapy for syphilis were all Italians. Therefore, Bachour suggests that “fumigation therapy might have been introduced into the Ottoman empire from Persia and after that, as a consequence of flourishing relations with Italy, into Europe, where it was further refined using a barrel-like appliance.”⁵⁸ However, the first Persian monograph on syphilis, the *Risāla-i ātašak* (“Epistle of the little fire”), written by Imād ad-Dīn Šīrāzī in 1569 CE, does not include prescriptions for fumigation with mercury. Nevertheless, it is described as a standard procedure

⁵⁶ See chapter 12 of the second section of the Śārṅgadharasamhitā.

⁵⁷ It is possible, however, that mercury was described as a fumigant in iatrochemical sections of contemporary or earlier alchemical works, which I have not consulted. Ainslie (1826: vol. 2., 354), paraphrasing a Tamil medical work he called Poorna Soostrum, described the use of a cinnabar product called shadilingum as a fumigant: “Eight pagodas weight of yercum vayr puttay (the bark of the root of the asclepias gigantea), four pagodas weight of shadilingum, and one pagoda weight of pepper, are all to be ground together, with the juice of the leaves of the paratie cheddie (gossypium herbaceum), and when well ribbed, to be formed into twelve cakes and dried. The fumes of one of these cakes, while burning, to be inhaled daily, through a smoking pipe, either all at once, or at two different periods in the twenty-four hours. Fumigation of this sort may be continued for five or six days, according to circumstances; and is efficacious in the two disorders called by the Tamools *kannosie* and *kanna poottoo* (cancerous affections), in venereal ulcers of the throat and nose, and in a disease attended with a singular pricking pain in the scull.” Tamil medical works are thought to be closely connected to Indian alchemical traditions, and therefore the occurrence of mercury as a fumigant in this particular work could go back to an original prescription in an older alchemical work.

⁵⁸ See Bachour in this volume.

in the literature of Unani (or Graeco-Islamic) medicine as C. Preckel shows in this volume.

— There is a case to be made that the idea of fumigation with mercury ultimately goes back to Chinese medicine: The sixteenth-century Bencao Gangmu mentions the use of mercury as a fumigant and since its author Li Shizhen often relied on information from older works, it seems likely that there was a Chinese precedent of fumigation with mercury, if perhaps not against syphilis.⁵⁹ Li Shizhen describes using mercury for fumigation by preparing small sticks of mixtures of mercury (most often in the form of cinnabar) and other substances (minerals, herbs and, in one case, a snake). In most recipes, the fumes of these sticks would be applied to the affected body parts. One prescription, which describes burning a mixture of cinnabar, realgar and soot inside a quilt that covers the patient is perhaps similar to the European sweating bed.⁶⁰ However, one should note that Li Shizhen's fumigation stick recipes are much more complex than Bhāvamiśra's fumigation pills of mercury sulphide and rice, usually adding several ingredients.

As for the internal use of mercury, it is difficult to pinpoint the exact moment a mercury preparation was consumed for medical purposes in Europe. Up to, and indeed during the sixteenth century, most university-trained physicians seem to have generally been biased against the internal use of mercury, but some informal medical practices of consuming mercury preparations seem to have existed. The sixteenth-century Renaissance physician Paracelsus became famous for advocating the internal use of mercury in Europe. Paracelsus was critical of the Arabic-style multi-component mercurial salves and instead suggested making mercury the main component of treatment and using it internally.⁶¹ His medicine against syphilis, called *Turpethum minerale*, the exact recipe of which is not known, was probably some form of mercury sulphide.

Corrosive sublimate had been known in Europe for much longer. Some procedures for producing it are described in Gerard of Cremona's *De Aluminibus et Salibus* (twelfth century CE), an influential work believed to have been translated from an Arabic version of a Persian alchemical work by Muhammad ibn Zakariyā Rāzī (Rhazes), probably either his *Al-asrar* ("The

⁵⁹ See the section on drugs for treating syphilitic skin lesions in the chapter "On medicines for the treatment of the hundred diseases" (Baibing zhuzhi yao), Shizhen 2003: I, 676–679, esp. 678–679 "The Category of Metals and Stones". My sincere thanks to Dr Daniel Trambaiolo for clarifying the title of the chapter and its position in the treatise.

⁶⁰ For details of these recipes, see Shizhen 2003: I, 678–679.

⁶¹ See Lesky 1959: 3182.

Secret”) or his later work, *Sirr Al-asrar* (“Secret of Secrets”).⁶² And in the thirteenth century, Raymund Lull (Ramon Llull) described how to make a medicine from it that was to be taken internally.⁶³

Calomel, however, was only “discovered” in Europe in the early seventeenth century: Jean Béguin wrote about it in 1608, Oswald Croll in 1609.⁶⁴ It appeared in John Woodall’s *Surgion’s Mate* of 1617, the latter “published chiefly for the benefit of young sea-surgions imployed in the East-India Companies affaires”⁶⁵ and was recorded in the first London Pharmacopoeia in 1618.

The Indian recipes for *rasakarpūra* and its precursors, which seem to have produced a mixture of calomel and corrosive sublimate, therefore clearly pre-date the European recipes for calomel, though perhaps not as definitively for corrosive sublimate. Furthermore, calomel only really started being used internally in Europe in the eighteenth century, after the Dutch physician and botanist Herman Boerhaave (1668–1738) and the Scottish physician and chemist Andrew Plummer (1697–1756) advocated its internal use against syphilis. Boerhaave’s pupil, the Dutch-Austrian physician Gerard van Swieten (1700–1772) is credited with popularizing calomel across Europe.⁶⁶ Indeed, Mark Harrison argues that Europeans, and particularly the British were influenced by Indian medicine in their use of mercury, the latter developing a colonial medicine with theories and methods of treatment that were quite distinct from those of the medical establishment in Britain. Harrison describes how two surgeons of the East India Company, John Wilson and Gilbert Pasley, began to administer calomel pills to patients diagnosed as suffering from inflammatory diseases of the liver in the 1750s.⁶⁷ This was non-standard practice, as calomel was more or less exclusively used against venereal disease in Britain at that time, though Boerhaave had already endorsed the use of calomel against non-venereal complaints some decades earlier. Harrison suggests that the two surgeons probably “drew their inspiration from the bazaar located near the Madras hospital, in which Indian practitioners regularly sold mercurial remedies. (...) Both men had a contract to supply their hospital with bazaar medicines and would have been familiar with local practices; they would have regularly purchased mercury, which was

⁶² See Needham et al. 1997: 124, note a.

⁶⁴ See Lesky 1959: 3183.

⁶⁵ This is a subheading on the title page of Woodall 1617.

⁶⁶ On Boerhaave, Plummer and van Swieten as advocates of the internal use of calomel in medicine, see Lesky 1959: 3184.

⁶⁷ See Harrison 2010: 146–147.

already extensively used to treat venereal complaints.”⁶⁸ However, the degree to which Wilson and Pasley were in fact influenced by local practice – other than using local products – cannot be ascertained. The other ingredients of their calomel pills, gum arabic and ipecacuanha, were certainly not standard ingredients in ayurvedic medicine or Siddha (a South Indian medical tradition that is closely related to the classical Sanskrit medical tradition, see also the contribution by Brigitte Sébastia in this volume) – at least not ipecacuanha, a South American plant known in Europe since the seventeenth century.⁶⁹

To conclude the list of differences between Bhāvamiśra’s and European views on mercurial therapies, treatments with mercury were associated with severe side effects in Europe, developing sores and swelling in the mouth and throat being among them. Another symptom of mercury treatment noted in Europe, first as a desired effect of mercury treatment and later as a sign of overdose, was extreme salivation. Surprisingly, salivation is not mentioned at all in the context of mercury treatment in the Bhāvaprakāśa. A contemporary alchemical and iatrochemical work, the Rasaratnasamuccaya, describes “*udgāra*” as a symptom of “mercury sickness” (Sanskrit: *pāradavikāra*).⁷⁰ *Udgāra* can mean “spitting” and “salivation”, but more commonly means “eructation”. In the medical works, salivation as a symptom of mercury poisoning (interpreted as being caused by the intake of unpurified mercury) seems to have first been described in the Bhaiṣajyaratnāvalī (Chapter 97 *pāradavikāracikitsāprakaraṇam* 8). The word used here is *lālāsraṇa*: the “morbid flow of saliva”. This important medical work is usually dated to the eighteenth century. However, there is reason to date some parts of it to the nineteenth century, including the chapter on mercury poisoning.⁷¹

As for swelling in the mouth, Bhāvamiśra does remark upon it, albeit only to claim that his medicine would not cause it (see *madhyakhaṇḍa* 59.11 and 30). This, however, implies that Bhāvamiśra was aware of the possibility of causing swelling in the mouth through mercury treatments. Strangely, he does not list this symptom as one of the problems associated with mercury therapy in the section dedicated to the dangers of mercurial treatments (*pūrvakhaṇḍa dhātvādivarga* 90–95), just as no mention of salivation is found there. In that section, Bhāvamiśra explains that mercury can have two kinds of faults, innate (*naisargika*) and acquired (*upādhiya*) ones. The innate faults of mercury are

⁶⁹ See Flückiger 1867: 230 on the history of the use of ipecacuanha.

⁷⁰ See Rasaratnasamuccaya 11.132. On the treatise, see Meulenbeld 1999–2002: IIA, 666–674.

⁷¹ See Meulenbeld 1999–2002: IIA, 336 on the dating of this work. The Govindadāsa et al. 2006 edition of the Bhaiṣajyaratnāvalī was consulted for this article.

defined as dirt (*mala*), poison (*viṣa*), fire (*vahni*), heaviness (*gurutva*), and being unsteady (*capala*), the acquired faults as the admixture of tin (*vaṅga/trapu*) and lead (*nāga*).⁷² Each fault is associated with a particular problem: Dirt causes fainting, poison kills, fire causes a severe burning sensation, heaviness leads to exhaustion and unsteadiness to the loss of virility; tin produces skin disease (perhaps leprosy) and lead causes impotence. Bhāvamiśra (*pūrvakhaṇḍa dhātvādivarga* 100) concludes that

therefore, mercury must be purified before use. The faults of fire, poison and dirt are the most severe, and must be removed. Consuming mercury that has not been subjected to different processes will destroy the body or give rise to diseases like leprosy.⁷³

It is important to understand that mercury used in any ayurvedic recipe should have been processed according to prescription, and it would have therefore been considered safe: According to the ayurvedic view, proper treatment with mercury should never have negative consequences.⁷⁴

6 Conclusion

In conclusion, it is not quite possible to make out a definite connection between the Bhāvaprakāśa's prescriptions and standard early to mid-sixteenth century European methods of using mercury as an antisyphilitic. At the same time, one cannot entirely discount the possibility that Bhāvamiśra's mercury treatments were inspired by European methods of treating syphilis either. In the case of fumigation with mercury, it seems at least possible that this treatment was introduced to India by Europeans, though it may equally have been adopted from Persian medicine or indeed Chinese medicine (perhaps via Persian

⁷² One should note that neither tin or lead are considered to be a poisonous substance on their own, but are also listed as medicinal substances in Bhāvaprakāśa *pūrvakhaṇḍa dhātvādivarga*.

⁷³ The methods Bhāvamiśra suggests for ridding the mercury of its faults are mixing it with various substances. This is called *mardana* (maceration) or *mūrchana* (thickening, solidifying) and both are understood to be methods of purification (*śodhana*). See Bhāvaprakāśa *pūrvakhaṇḍa dhātvādiśodhanamāraṇavidhiprakaraṇa* 157–160, and 165–166. Bhāvamiśra also describes various sublimation processes for purifying mercury, one set of which is called *māraṇa* (“killing”), in which mercury is reduced to ash. The method for producing *rasakarpūra* is included in this set of procedures, so that its production should be understood as part of the purification (or perfecting) process. See *pūrvakhaṇḍa dhātvādiśodhanamāraṇavidhiprakaraṇa* 161–199, and 182–190 on *rasakarpūra* specifically. On ayurvedic methods of purifying mercury, see Wujastyk 2013.

⁷⁴ On the treatment of mercury poisoning in various alchemical and medical works, see Wujastyk 2013.

medicine). And finally, one must also keep in mind that there were a great many methods in Europe of treating syphilis with mercury, and even more different recipes for mercurial medicines, many of which may never have been written down so that one cannot completely rule out a connection between Bhāvamiśra's other prescriptions and European methods.

A further examination of the links between the antisymphilitic therapies of Persian, Chinese and Indian medicine might not only shed light on the history of syphilis but might also lead to a deeper understanding of the historical connections and entanglements of Chinese, Persian and Indian medicine.
