The biological flora of Central Europe – an ecological bibliography

PETER POSCHLOD*, DIETHART MATTHIES**, SILKE JORDAN
& CHRISTINA MENGEL

Fachbereich Biologie, Naturschutz II, Philipps-Universität Marburg, Karl-von-Frisch-Strasse,
35032 Marburg, Germany, *corresponding author: poschlod@mail.uni-marburg.de,

**Institut für Umweltwissenschaften, Universität Zürich, Winterthurerstrasse 190, 8057
Zürich, Switzerland

Summary

A list of Central European species is given for which accounts exist in one or more of four biological floras: (1) “Lebensgeschichte der Blütenpflanzen Mitteleuropas”, (2) “Biological flora of the Moscow region”, (3) “Biological Flora of the British Isles”, and (4) “Biology of Canadian Weeds”. The history, aims and concepts of these biological floras are presented briefly. The list is a reference for the planned “Biological Flora of Central Europe”, and a source of information for ecologists and vegetation scientists interested in biological and ecological characteristics of individual species.

Keywords: history of biological floras, plant species biology, reference list

Bulletin of the Geobotanical Institute ETH (1996), **62**, 89–108

Introduction

The first biological flora, i.e. a flora that contains mainly biological and ecological information, was started as a series by Kirchner *et al.* (1908 ff.). It was called “Die Lebensgeschichte der Blütenpflanzen Mitteleuropas” (The life history of higher plants of Central Europe). The reason for starting this series was stated in the introduction, in which the authors expressed their conviction that the ultimate aim of botany should be the study of the life history of all plant species. They had, however, serious doubts that other botanists in Central Europe shared this conviction. Their scepticism was appropriate. Publication of their own series ceased in 1940, and to date no further attempt to

publish a biological flora has been made in Central Europe.

However, in other regions several biological floras have since been started that are still continued, e.g. in the British Isles (British Ecological Society 1941; Clapham *et al.* 1958) and in Russia (Rabotnov 1974 ff.). Nevertheless, the series initiated by Kirchner *et al.* (1908 ff.) is with more than 300 species still the most comprehensive, although now rather dated, biological flora.

In the last years studies of the life history and population biology of plants have become more frequent in Central Europe. Thus, there is now a lot of material on the biology of Central European plants available. There-

fore, an initiative for a biological flora of Central Europe was launched within the framework of the "Working Group on Plant Population Biology" of the German Ecological Society (Matthies & Poschlod, in press).

In the following we present a list of species occurring in Central Europe for which accounts already exist in other biological floras, together with information where and when these have been published. This reference list is a basis for the ecological flora of Central Europe. The old references are useful for preparing accounts, but the list also indicates for which species no recent accounts are available and on which work should therefore be concentrated. Moreover, the list can also be valuable for plant ecologists and vegetation scientists interested in information on the biology of individual species. The ecological floras differ in their structure, main emphasis and content. We therefore present for each flora a brief overview of its history, aims and concept.

Biological floras

THE "LEBENSGESCHICHTE DER BLÜTENPFLANZEN MITTELEUROPAS"

The series "Lebensgeschichte der Blütenpflanzen Mitteleuropas" started at the beginning of this century (Kirchner *et al.* 1908 ff.). Its aim was to present eventually a detailed description of the life history characteristics of all native species, but also to counter the fragmentation of botanical and ecological research. The authors felt that specific phenomena could only be understood if they were considered within the framework of the whole life history of the species.

However, only certain aspects of the biology of plants were considered, especially morphology (life form, growth form, ontogenesis), habitat requirements and adaptations to the habitat, reproductive biology and dis-

persal. Information on many aspects of plant biology, for example germination, hybrids, pathogens and diseases was missing.

The series remained unfinished. Publication ceased in 1940 when only a small proportion of the Central European flora had been dealt with. Moreover, the amount of information given varied widely among species. Today the series is nearly forgotten and is cited only rarely. However, although a lot of further knowledge has since been accumulated, the "Lebensgeschichte der Blütenpflanzen Mitteleuropas" is still a useful source of information.

THE "BIOLOGICAL FLORA OF THE MOSCOW REGION"

In 1974 the first volume on the "Biological Flora of the Moscow Region" was published (Rabotnov 1974 ff.). Preliminary work for that flora had already started in 1937 (Jarosenko 1937) and another initiative was taken by Tichomirov (1952). One reason for the publication of the series was the concern that because of the increasing specialization of botanical research the holistic view of plant species might be lost (cf. Kirchner *et al.* 1908 ff.). The final aim was to publish an encyclopaedia of the knowledge about the biology of individual plant species. To date, eight volumes which include accounts on about 220 species have been published.

As in Kirchner *et al.* (1908 ff.) the main focus is on morphology and patterns of plant growth. Seasonal ontogenetic rhythms, reproduction and dispersal are also presented from a morphological point of view. Information on hybridization, germination, pathogens, diseases, habitat requirements, phytocoenology and commercial importance is also given. We do not know whether the series is continued. The last volume was published in 1990.

THE "BIOLOGICAL FLORA OF THE BRITISH ISLES"

A biological flora of the British Isles had already been proposed by Salisbury (1928). In 1941 the British Ecological Society finally called for papers. It was intended "that the flora will eventually become a complete account of the biology of all British flowering plants, conifers and pteridophytes, including naturalized aliens" (British Ecological Society 1941). The series is published in the *Journal of Ecology*. Not until 1958 a guide for contributors was published (Clapham *et al.* 1958). The structure of each account is as follows: Taxonomy, geographical distribution, habitat, sociology, response to biotic factors, morphology and variability including life and growth form, mycorrhiza, number of chromosomes, physiological data, phenology, floral biology, hybrids, seed production, dispersal and germination, seedling morphology, animal feeders, plant parasites and diseases, and finally, history of the species. In this form the series is still continued. The "Biological Flora of the British Isles" is one of the best sources of information on individual plant species. However, to date accounts on only 225 species have been published and many of the older contributions are very short.

THE "BIOLOGY OF CANADIAN WEEDS"

Following the example of the "Biological Flora of the British Isles" the 'Canada Weed Committee' initiated the series "Biology of Canadian Weeds" in the *Canadian Journal of Plant Sciences* in 1972 (Cavers & Mulligan 1972). The aim of this series is to summarize all published and unpublished information on the biology of Canadian weeds which could be used as a basis for an effective weed con-

trol. The structure of the accounts is similar to that used for the "Biological Flora of the British Isles". In addition information on the reaction of plants to herbicides and other chemicals and about parasites and their value for weed management is given. The series is still continued and accounts on about 100 species have been published to date. Many of those species occur also in Central Europe.

OTHER BIOLOGICAL FLORAS

In 1988 a series called 'Materials for knowledge of the rare and endangered species of Poland' was initiated (Sokolowski 1988). In 1988 and 1989 papers on twelve species were published, but no further papers since. The main focus of the ecological flora of the Netherlands (Weeda 1985 ff.) is like that of the flora by Oberdorfer (1994) on habitat requirements, but both floras also contain some information on the biology of species. Biological data for the more common British species are given in a brief overview in the "Comparative Plant Ecology" (Grime *et al.* 1988).

In the last years more and more electronic data bases are compiled which contain data on the biological and ecological characteristics of plant species (e.g. Frank & Klotz 1990; Ellenberg *et al.* 1992; Fitter & Peat 1994; Hodgson *et al.* 1995; Lindacher 1995). The Dutch office of statistics has published a "Botanisch Basisregister" that contains ecological and biological data for plants occurring in the Netherlands.

Such data bases are a valuable tool for the analysis of vegetation relevées and for landscape planning. However, these data bases cannot replace detailed monographs because they necessarily contain relatively little information. Detailed descriptions are not possible because of the inflexible input masks.

The reference list of species studied

Table 1 is a reference list of all species of the Central European flora (*sensu* Ehrendorfer 1973) for which accounts have been published in one of the biological floras, which are described above in detail. In addition, some species are listed that have been included in the Polish series.

The table lists the abbreviation of the species name according to Ehrendorfer (1973), the name (synonym) used in the publication, the year of publication, the volume and pages in the respective series. Nomenclature in the list follows Ehrendorfer (1973), except for some plants which are not included in the list of Ehrendorfer, but are included in Hegi *et al.* (1908 ff.).
