Distribution, ecology and phenology *Abrahamia oblongifolia* occurs in far northern and northwestern Madagascar (Map 6), from sea level to an elevation of c. 300 m, usually along rivers or at the base of hills or mountains. Flowering material has been recorded in October and November, and fruits have been collected in December and January.

- Conservation status** With an EOO of 3,220 km², a minimum AOO of 32 km², and estimated maximum AOO of < 500 km², and 7 recorded localities representing 7 locations with respect to the threat of forest exploitation, and with subpopulations in 2 protected areas (Analamera and Montagne des Français) and projected decline outside of protected areas, *A. oblongifolia* is assigned a preliminary conservation status of “Vulnerable” [VU B1ab(iii)+2ab(iii)] using the IUCN Red List Categories and Criteria (IUCN, 2012).
- Notes** *Abrahamia oblongifolia* can be distinguished from all other members of the genus by the combination of its numerous secondary veins (35-40), both terminal and axillary inflorescences, and glabrous fruits.
