First-order evolution in geodesy and industry

Modern technology has come up with a new precision level, the **Wild N3**, designed to bring the highest accuracy to the most varied tasks: first-order levelling for geodetic control, deformation measurements, determining subsidence and monitoring crustal movements. It's perfect too for industry and laboratories: for checking, aligning and positioning machinery, and for measuring inclinations.

The powerful **panfocal telescope** has over 40× magnification at normal sighting distances, yet it will focus to a scale **only 30 cm (12 inches)** from the objective. The field of view widens at short distances. And it's an alignment telescope with remarkable stability of the line of sight.

With the calibrated tilting screw, small angles and changes in inclination can be measured with micro-

meter accuracy for optical tooling purposes as well as for river crossings in geodesy. The autocollimation eyepiece converts the N3 into an autocollimation instrument; the laser eyepiece transforms it into a laser level.

The **Wild N3** is an ultra-modern precision level. From its predecessor it has inherited its unmatched accuracy – a standard deviation of ± 0.2 mm for 1 km double run levelling – and its absolute reliability.

1
RESTON Pot Sliding Bearings are highly suitable for installation in bridge structures. They feature a low-profile design, low weight and high loading capacity.

2
RESTON Linear Tilting and Sliding Bearings are a combination of normal linear tilting bearings and PTFE sliding bearings and are suitable for installation in bridge structures.

3
LASTO-BLOCK Bearings are suitable for building, civil engineering and bridge construction applications. Their simple form allows easy installation.

4
LASTO-STRIP Bearings for Buildings were especially developed for building constructions. They are particularly suitable for movement compensation between concrete slabs and load-supporting walls and prevent structural cracking.

5
TENSA-ACME Roadway Construction Joints are highly suitable for installation in traffic levels (parking lots, bridges, airport areas etc.). Dilatation up to 60 mm.

6
TENSA-LASTIC Roadway Construction Joints meet all the requirements that can be made in bridge engineering of a modern joint design. They are rugged and watertight. Dilatation range 60 mm and bigger.
