**Names as legacy:
Catalogue of taxa described by and for Michel Brancucci (1950–2012)**

by Peter Nagel, Lara Schmidlin & Michael Geiser

Abstract. This article provides a compilation of the taxa introduced to science by the late Dr. Michel Brancucci, Basel, and of the taxa named in honour of him. We provide details of nomenclatorial value such as holotype depository (for species described by Michel Brancucci), page number of the original description and type locality. References of the original descriptions are given in full and the actual publication dates were thoroughly checked. Indices to all taxa complete this article and make it a searchable catalogue.

Keywords. Michel Brancucci – patronyms – taxonomic publications – references of described taxa

Introduction

During his professional career, Dr. Michel Brancucci held many important posts. He was the curator of Coleoptera, the head of the entomological department and deputy director of the Natural History Museum of Basel, as well as president of the Swiss entomological society. Sketches of his life and work already formed part of the obituaries by BURCKHARDT (2012) and KLAUSNITZER (2012). Details on his Laos projects are given by GEISER & NAGEL (2013). These field visits to Laos were Michel Brancucci's last major collecting trips. Earlier travels to study the beetle diversity of subtropical and tropical areas focused on Nepal and the northern provinces of Pakistan and India (Himachal Pradesh, Uttarakhand, Darjeeling, Sikkim) (starting 1977 with Walter Wittmer, see BRANCUCCI 2005).

A very large amount of data was available for his scientific research, owing to the extensive material he organised from his own collecting journeys as well as through purchases for the Natural History Museum of Basel. He was a taxonomic specialist for Cantharidae and Dytiscidae, but also dealt competently with related taxa of the Hydradephaga and Lampyridae. His diploma thesis (equivalent to MSc thesis) focused on communities of aquatic invertebrates in Europe, and he later used this knowledge by teaching regular field courses on this topic at the University of Basel.

The large amount of data made available by him for scientific purposes, as well as his good networking, renownedness and popularity in the entomological community entailed the naming of numerous taxa after him.

He published 142 scientific publications, whereof in 78 of these publications 235 new taxa are described.

When remembering a taxonomist such as Michel Brancucci it is however not primarily important how many new taxa were described by and after a person, but how this person is positioned within the entomological community. Michel Brancucci published taxonomic works according to the good scientific practice. Through his activities of collecting, describing and archiving species as well as publishing, he

contributed considerably to the knowledge of the most species-rich group of the mega-diverse insects, the Coleoptera, and to the Dytiscidae and Cantharidae in particular. He managed to generate knowledge on the existence of copious species before they might become extinct together with their habitats. In this day and age taxonomists like Michel Brancucci are in even more pressing demand as one can only protect what is known.

The names of these scientists stay present especially by the taxa newly described by them as well as by the taxa named in honour after them. We are pleased to present the following compilation as a source of information and a work of reference, but also as documentation of the contribution made by Michel Brancucci and last but not least as appreciation of a loveable colleague.

The aim of the present contribution is the provision of an informative catalogue (i.e. with as many details as feasible) of all taxa described by Michel Brancucci and of all patronyms up to mid-2015.

Taxa introduced to science by Michel Brancucci

For the compilation of the following list we consulted all publications of Michel Brancucci, including the ones published posthumously. They are bound up to 2010 in four volumes and deposited in the library of the Natural History Museum of Basel. A list of Michel Brancucci's publications up to 2011 was published by KLAUSNITZER (2012) and a list up to "2013 in press" was published by BURCKHARDT (2012). The following compilation comprises all publications containing descriptions of new taxa. The newly described taxa are recorded chronologically under the respective reference. For nomenclatural purposes we provide the full reference data and also added the actual publication date and its reference. It is given in square brackets at the end of each reference. We also provide an index of all names introduced to science by Michel Brancucci.

All taxa are reported in their original rank and spelling. The following information is also given for every taxon: the page number of the description, information on type specimens, such as depository and sex of holotype specimen, the number of paratypes, and, if applicable, for family and genus group taxa, the type genus, the type species and mode of designation. New generic assignments or synonyms are listed as "(= ...)", provided they became known to us.

We quote the geographic type locality data in the form it was published originally; sometimes, however, further details are given in the publications, for example more exact information on the habitats. Missing country names have been added by us and are placed in square brackets. The entry "type locality" is complemented by data on the collector and the sampling date of the holotype specimen, if available.

Michel Brancucci introduced three family group taxa (Cantharidae), described seven genus group taxa (Cantharidae, Dytiscidae) and 225 species group taxa (mainly Dytiscidae and Cantharidae), sometimes with co-authors. Most of them were described in his house journal, "Entomologica Basiliensia" (title from Vol. 27, 2005: "Entomologica Basiliensia et Collectionis Frey"). Larger revisions and fauna

monographs, sometimes with co-authors, were, for example, published on the dytiscid genera *Lacconnectus* Motschulsky, 1855, and *Laccophilus* Leach, 1815, the cantharid genera *Belotus* Gorham, 1881, *Malchinus* Kiesenwetter, 1863, and *Maronius* Gorham, 1881, the lampyrid genus *Lamellipalpus* Maulik, 1921, as well as the Cantharidae of Taiwan. He was the co-author of the section on Cantharidae in the Catalogue of Palaearctic Coleoptera (LÖBL & SMETANA 2007).

The newly described taxa are mostly from the Indomalayan and East-Palaeartic regions, yet he also described taxa from other parts of the world such as South America, Australia, Africa, and Europe. Amongst Michel Brancucci's many descriptions is the discovery of the first terrestrial dytiscid beetle (BRANCUCCI 1979). One dytiscid beetle was described from Tibet at 5,100 m altitude (BRANCUCCI & HENDRICH 2008). He also discovered a high-altitude predacious water beetle from the frontier area Nepal / Tibet at 4,000 m altitude, which reveals a most interesting Palaeartic-Afrotropical disjunction (BRANCUCCI & HENDRICH 2006).

Michel Brancucci's first description of new taxa was published in a paper together with his mentor, Walter Wittmer, in 1978. His last descriptions were partly written while he was already in a hospice and were published posthumously in "his" journal *Entomologica Basiliensia et Collectionis Frey* in 2013.

Taxa dedicated to Michel Brancucci

We searched the “Zoological Record” for the years 1978 to 2015, the collection databases of the NHMB and BMNH, as well as following online data bases: Global Names Index <<http://gni.globalnames.org/>>, Index to Organism Names <<http://www.organismnames.com/>>, Encyclopedia of Life – Animals – Plants – Pictures & Information <<http://eol.org/>>, and Catalogue of Life <<http://www.catalogueoflife.org/>> for species named after Michel Brancucci. A few additional names became known to us through other sources.

The listed records are complete with exception to the title of the articles, as these are not essential for tracing the reference. The bibliographic details of all records were checked, including the date of the actual publication.

The classification at family level is organised according to BOUCHARD *et al.* (2011) for Coleoptera. The order of the genera within each family is alphabetical. The genera under which the new species were originally described are given. New generic assignments or synonyms “(= ...)” are listed after the original genus, provided they became known to us. The page number indicates the start of the description of the new species. The country of the *locus typicus* is listed in English in round brackets.

We found 158 animals, which were named after Michel Brancucci, belonging to 35 families and five orders. The animals named in honour after Michel Brancucci do not all belong to the Coleoptera but also to the Dermaptera, Heteroptera, Hymenoptera and Diptera. Especially beetles belonging to the families Chrysomelidae and Elateridae were named after him.

The dedication is mostly achieved by use of his surname (resulting in “*brancucci*”), sometimes also by use of his first name (resulting in “*micheel*”). In total 91 taxonomists named a taxon after Michel Brancucci. Taxa from Laos, but also many from Nepal were named after him in particular.

Despite careful and intensive research a few already existing patronyms will have escaped our notice; additionally, more taxa will be named after Michel Brancucci in the future, hereby keeping his dedication for the acquisition and documentation of biodiversity data, specially that of Laos, in good memory.

Acknowledgements

We are grateful for the help we received from the Natural History Museum of Basel, especially from the entomological staff and the librarian. Eva Sprecher-Uebersax, in particular, helped trace original information from the libraries as well as from the collections. We thank Thierry Deuve, Muséum National d'Histoire Naturelle, Paris, for his helpful comments on the dating of one publication.
