# Industrial Production Models

A Theoretical Study

By Dr. Sven Danø

Professor of Managerial Economics  
University of Copenhagen

With 71 figures. VIII, 220 pages. 8vo. 1966

Full cloth DM 39.—

The need for a modern comprehensive text of the microeconomic theory of production has made itself felt for many years. The book is intended to fill this gap in economic literature. The book gives a thorough-going theoretical treatment of a wide variety of production models for industrial processes taking place within an individual firm — with particular emphasis on the substitution aspect — and the corresponding optimization problems, including shadow pricing. Not only production functions of the "neoclassical" type are dealt with; linear models and many other kinds of input-output relationships — including various multi-product cases of alternative or joint production — are treated in detail.

In addition, the book takes up a number of related problems which have usually been given less than due attention in the literature, such as factor divisibility, the role of the time factor and the shape of the cost curve; quality variation and the production function; and plant vs. process production functions (problems of integration and suboptimization).
