by  $[a_0, a_1, \dots, a_n]$ . For  $0 \leq m \leq n$  we denote the numerator and denominator of the  $m^{\text{th}}$  approximant to  $[a_0, a_1, \dots, a_n]$  by  $A_m$  and  $B_m$  respectively.

If  $p$  is a prime of the form  $4n + 1$ , then

$$(2) \quad \sqrt{p} = [a_0, \overline{a_1, \dots, a_m, a_m, \dots, a_1, 2a_0}]$$

in the usual notation for a periodic continued fraction. The symmetric part of the period does not have a central term. In [1] we proved that  $p = x^2 + y^2$  where

$$(3) \quad x = pB_m B_{m-1} - A_m A_{m-1}$$

$$(4) \quad y = A_m^2 - pB_m^2$$

and where  $\frac{A_m}{B_m}$  is the  $m^{\text{th}}$  approximant to (2). We also showed that

$$(5) \quad p = \frac{A_m^2 + A_{m-1}^2}{B_m^2 + B_{m-1}^2}.$$

### 3. THE QUADRATIC CHARACTER OF

$$\frac{(2n)!}{2(n!)^2}.$$

It is well known that if  $p$  is a prime of the form  $4n + 1$  then  $\{(\frac{p-1}{2})!\}^2 \equiv -1 \pmod{p}$ ; that is,  $(2n)!^2 \equiv -1 \pmod{p}$ . We make use of this in the

LEMMA. If  $p = 4n + 1$  is a prime then  $\frac{(2n)!}{2(n!)^2}$  is a quadratic residue of  $p$ .

Proof. We use Euler's criterion. Thus if we suppose that  $\frac{(2n)!}{2(n!)^2}$  is a quadratic nonresidue of  $p$  we have  $\{ \frac{(2n)!}{2(n!)^2} \}^{\frac{p-1}{2}} \equiv -1 \pmod{p}$  and thus  $\{ (2n)!^2 \}^{\frac{p-1}{4}} \equiv -\{ 2(n!)^2 \}^{\frac{p-1}{2}} \pmod{p}$ . Since  $(2n)!^2 \equiv -1 \pmod{p}$  and  $n!^{p-1} \equiv 1 \pmod{p}$  we have  $(-1)^n \equiv -2^{\frac{p-1}{2}} \pmod{p}$ , or  $(-1)^{n+1} \equiv (-1)^{\frac{p^2+1}{8}}$ , using the standard result for the quadratic character of 2 with res-

pect to an odd prime. We finally get  $(-1)^{n+1} \equiv (-1)^{2n^2+n}$  or  $(-1)^{n+1} \equiv (-1)^n \pmod{p}$  which is a contradiction since  $p$  is an odd prime. Thus  $\frac{(2n)!}{2(n!)^2}$  is a quadratic residue of  $p$ .

#### 4. THE CONSTRUCTION OF GAUSS

**THEOREM.** Suppose  $p = 4n + 1$  is a prime and  $p = x^2 + y^2$  where  $x$  and  $y$  are given by (3) and (4). Let  $\beta$  and  $\alpha$  denote respectively the numerically smallest residues of  $\frac{(2n)!}{2(n!)^2}$  and  $(2n)! \beta$  modulo  $p$ , so that  $|\alpha| < \frac{p}{2}$ ,  $|\beta| < \frac{p}{2}$ . Then  $p = \alpha^2 + \beta^2$ .

**Proof.** By (5) we have, using the remark at the beginning of section 3,  $A_m^2 + A_{m-1}^2 \equiv 0 \pmod{p}$  and hence  $-A_m^2 \equiv A_{m-1}^2 \pmod{p}$ , so that  $\{(2n)!\}^2 A_m^2 \equiv A_{m-1}^2 \pmod{p}$ , and since  $p$  is a prime  $(2n)! A_m \equiv \pm A_{m-1} \pmod{p}$ . Supposing the negative sign holds we have  $(2n)! A_m^2 \equiv -A_m A_{m-1} \pmod{p}$ . Therefore we obtain  $(2n)! A_m^2 - (2n)! pB_m^2 \equiv (pB_m B_{m-1} - A_m A_{m-1}) \pmod{p}$ , so that by (3) and (4) we get

$$(6) \quad x \equiv (2n)! y \pmod{p}.$$

If the positive sign holds above it follows that  $x \equiv -(2n)! y \pmod{p}$  which is just as good for our present purposes since we are not concerned with the signs of  $x$  and  $y$ . We will comment on the signs in section 5.

By the lemma we have  $\left\{ \frac{(2n)!}{2(n!)^2} \right\}^{\frac{p-1}{2}} \equiv 1 \pmod{p}$  so  $(2n)!^{\frac{p-1}{2}} \equiv 2^{\frac{p-1}{2}} (n!)^{p-1} \pmod{p}$ , and therefore  $(2n)!^{\frac{p-1}{2}} \equiv 2^{\frac{p-1}{2}} \pmod{p}$  since  $(n!, p) = 1$ . We have  $x \equiv \pm (2n)! y \pmod{p}$ , and since each of  $y$  and  $-1$  is a quadratic residue of  $p$ ,  $x^{\frac{p-1}{2}} \equiv (2n)!^{\frac{p-1}{2}} \equiv 2^{\frac{p-1}{2}} \pmod{p}$ , and in terms of the Legendre symbol it follows that  $\left( \frac{x}{p} \right) = \left( \frac{2}{p} \right)$ ; that is, the quadratic character of  $x$  with respect to  $p$  is the same as the quadratic character of 2 with respect to  $p$ .

Suppose 2 is a quadratic residue of  $p$ . Then
