INVARIANT SOLUTIONS OF ANALYTIC EQUATIONS

by Edward BIERSTONE and Pierre MILMAN

1. INTRODUCTION

Let \mathbf{k} be a field of characteristic zero with a non-trivial valuation. We consider a system of analytic equations

$$f(x,y) = 0,$$

where

(*)

$$f(x, y) = (f_1(x, y), ..., f_q(x, y))$$

are convergent series in the variables

$$x = (x_1, ..., x_n),$$

 $y = (y_1, ..., y_p).$

Suppose that

$$\bar{y}(x) = \left(\bar{y}_1(x), \dots, \bar{y}_p(x)\right), \ \bar{y}_j(x) \in \mathbf{k}\left[[x]\right],$$

are formal power series without constant term which solve (*); i.e. such that $f(x, \bar{y}(x)) = 0$. Let c be a non-negative integer. Artin's approximation theorem [3] asserts that there exists a convergent series solution

$$y(x) = (y_1(x), ..., y_p(x)), \quad y_j(x) \in \mathbf{k} \{x\},\$$

of (*), such that

 $y(x) \equiv \overline{y}(x) \mod \mathfrak{m}^c$.

Here m denotes the maximal ideal of \mathbf{k} [[x]].

Artin also proved an algebraic analogue of this theorem [1]. It says that if f(x, y) = 0 is a system of polynomial equations with formal series solution $\overline{y}(x)$, then a series solution y(x) may be found such that the $y_j(x)$ are algebraically dependent on $x_1, ..., x_n$ (we will say that the $y_j(x)$ are "algebraic"; cf. [2]). In this analogue **k** is an arbitrary field.

Let G be a reductive algebraic group (i.e. G is linear and every rational representation of G is completely reducible). Suppose that G acts linearly on $V = \mathbf{k}^n$ and $W = \mathbf{k}^p$. We will say that $\overline{y}(x) \in \mathbf{k}[[x]]^p$ is equivariant if

$$\overline{y}(gx) = g\overline{y}(x), \quad g \in G.$$

We will prove the following theorem.

THEOREM A. Suppose $\mathbf{k} = \mathbf{R}$ or \mathbf{C} , and that $\bar{y}(x) \in \mathbf{k}[[x]]^p$ is an equivariant formal power series solution of (*), $\bar{y}(0) = 0$. Let $c \in \mathbf{N}$. Then there exists an equivariant convergent series solution y(x) of (*), such that $y(x) \equiv \bar{y}(x) \mod \mathbf{m}^c$.

Moreover, if f(x, y) = 0 is a system of polynomial equations (where **k** is any field), then there exists an equivariant algebraic solution y(x), such that $y(x) \equiv \bar{y}(x) \mod m^{c}$.

Remark 1.1. Theorem A may be regarded in the context of the question: What properties of a formal solution of (*) may be preserved in an analytic solution? Artin [2] asked whether there is a convergent solution such that some of the variables x_i are missing in some of the series $y_j(x)$, provided there is a formal solution with the same property. Gabrielov [6] answered this question negatively (see also [4]). In [12] it is shown that if a formal solution of a system of real analytic equations satisfies the Cauchy-Riemann equations, then it may be approximated by complex analytic solutions.

Remark 1.2. Suppose that $\pi(x) \in \mathbb{C} \{x\}^r$ is an analytically regular germ of an analytic mapping (terminology of Gabrielov [7]). Let $F_i(x) \in \mathbb{C} \{x\}^p$, i = 1, ..., q. We may ask whether formal relations among the F_i of the form $(h_1(\pi(x)), ..., h_q(\pi(x)))$; i.e. q-tuples of formal power series of this form such that

$$\sum_{i=1}^{q} h_i(\pi(x)) F_i(x) = 0,$$

are generated by analytic relations of the same form. This question generalizes Gabrielov's problem in [7]. The answer is *no* in general, but the method of our proof of Theorem A shows it is *yes* if π is a finite analytic germ. As in our proof of Theorem A, it is then easy to see that a formal solution $\overline{y}(\pi(x))$ of a system of complex analytic equations f(x, y) = 0may be approximated by analytic solutions of the same form. We are grateful to Joseph Becker for pointing out the latter result to us. *Remark 1.3.* Tougeron [16] has proved a generalization of Artin's theorem which asserts, in particular, that every formal solution $\overline{y}(x)$ of (*) such that $\overline{y}(0) = 0$ is the formal Taylor series at 0 of an infinitely differentiable solution. The proof of Theorem A also gives an equivariant version of Tougeron's theorem.

Theorem A is closely related to the second result of this paper.

THEOREM B. Suppose that G acts linearly on $V = \mathbf{k}^n$, and that X is a closed algebraic subset of V which is invariant under the action of G. Then there exists a linear action of G on a finite dimensional vector space $Y = \mathbf{k}^q$, and an equivariant polynomial mapping $F: V \to Y$ such that $X = F^{-1}(0)$.

If $\mathbf{k} = \mathbf{R}$ or \mathbf{C} , and X is a germ at 0 of a closed analytic subset of V which is invariant under the action of G, then there exists a vector space $Y = \mathbf{k}^q$ on which G acts linearly, and a germ F of an equivariant analytic mapping of some neighborhood if $0 \in V$ into Y, such that $X = F^{-1}(0)$.

A linear action of G on \mathbf{k}^n induces an action on $\mathbf{k}[[x]] = \mathbf{k}[[x_1, ..., x_n]]$ (respectively $\mathbf{k} \{x\}, \mathbf{k} [x]$) such that

$$(g \cdot f)(x) = f(g^{-1}x)$$

for all $g \in G$ and $f(x) \in \mathbf{k}[[x]]$ (respectively $\mathbf{k} \{x\}$, $\mathbf{k} [x]$). Let $\mathbf{k} [[x]]^G$ (respectively $\mathbf{k} \{x\}^G$, $\mathbf{k} [x]^G$) be the subset of elements fixed by G (the *invariant* elements).

Remark 1.4. It is well-known that if $\mathbf{k} = \mathbf{R}$ and G is compact, then the conclusion of Theorem B holds with $F \in (\mathbf{R} [x]^G)^q$ (or $F \in (\mathbf{R} \{x\}^G)^q$ in the analytic case). In general, invariants separate only disjoint Zariski closed invariant subsets of \mathbf{k}^n , so that invariant closed algebraic or analytic subsets needn't be defined by invariant equations.

We will prove Theorem B in the following section, considering separately the complex analytic, real analytic, and algebraic cases. These results may also be obtained in a unified way, at least in characteristic zero, from an explicit projection formula related to the Fourier transform (cf. [15], [10, 12.2]). This formula may be of independent interest, and we have included it in section 4. In section 3 we will deduce Theorem A from Theorem B.

The authors enjoyed several conversations with Joseph Becker on the results in this paper.
