§ 1. PRELIMINARY REMARKS

Note that if R is a finite dimensional K -algebra and B is a filtered multiplicative basis (as defined above), then $B \cap \{\text{rad}(R)\}^n$ is a K -basis of $\{\text{rad}(R)\}^n$ for all $n \geq 1$. Indeed, the set $B \cap \{\text{rad}(R)\}^n$ is linearly free over K since B is. By hypothesis, $B \cap \text{rad}(R)$ is a K -basis of $\text{rad}(R)$ and thus the set of products $b_1 \cdot \dots \cdot b_n$ with $b_i \in B \cap \text{rad}(R)$ is a generator system for $\{\text{rad}(R)\}^n$. But all such products $b_1 \cdot \dots \cdot b_n$ are either 0 or belong to $B \cap \{\text{rad}(R)\}^n$. Hence, $B \cap \{\text{rad}(R)\}^n$ generates $\{\text{rad}(R)\}^n$ over K .

The case of a finite abelian group G is easy to understand:

Let

$$G_p = \langle a_1 \rangle \times \langle a_2 \rangle \times \dots \times \langle a_r \rangle$$

be a decomposition of the p -Sylow subgroup G_p of G as a direct product of cyclic groups of orders p^{n_1}, \dots, p^{n_r} respectively. Let $G = G_p \times H$, where $|H|$ is prime to p . Then,

$$B = \{(a_1 - 1)^{m_1} \cdot (a_2 - 1)^{m_2} \dots (a_r - 1)^{m_r} \cdot h \mid 0 \leq m_i \leq n_i - 1, h \in H\}$$

is a filtered multiplicative basis of $'KG$ for any field K of characteristic p .

If we insist that the elements of B outside $\text{rad}(R)$ should be orthogonal idempotents, then we have to require that K be algebraically closed, as otherwise KH itself need not have a filtered multiplicative basis B satisfying

MB3) If $e, e' \in B \setminus \text{rad}(R)$, $e \neq e'$, then $e^2 = e$ and $e \cdot e' = 0$.

Observe that, more generally, if B_1, B_2 are filtered multiplicative bases for KG_1 and KG_2 , then $B_1 \times B_2$ is a filtered multiplicative basis for $K[G_1 \times G_2]$.

In the next paragraphs we will examine examples of p -groups.

If G is a p -group, and K a field of characteristic p , then $\text{rad}(KG)$ is the augmentation ideal

$$\text{rad}(KG) = \left\{ \sum_{g \in G} \alpha_g g \mid \sum_{g \in G} \alpha_g = 0 \right\}$$

Note also that in that case, a filtered multiplicative basis B for KG necessarily contains 1. Indeed, $\dim_K \{KG/\text{rad}(KG)\} = 1$. If $e \in B$ is the unique element outside $\text{rad}(KG)$, then $e^2 \notin \text{rad}(KG)$ and therefore $e^2 = e$. But KG is local, thus $e = 1$. (Alternatively, $e = 1 + r$ with $r \in \text{rad}(KG)$ and $e = e^{p^N} = 1 + r^{p^N} = 1$.)

Thus for p -groups, axiom MB3) is automatically satisfied.
