- (ii) not commutative, i.e., generally, $XY \neq YX$ (but see (4) (iv) below);
- (iii) not associative, i.e., generally, $(XY)W \neq X(YW)$ (but see (7) below).
- (4) The real part of $X \equiv (q_1, q_2)$ is $\operatorname{Re} X = (\operatorname{Re} q_1, O) \equiv \operatorname{Re} q_1$. X is said to be real if $X = \operatorname{Re} X$; i.e., (q_1, q_2) is real iff q_1 is real and $q_2 = 0$.
 - (i) Re(X + Y) = Re(X) + Re(Y).
 - (ii) $\operatorname{Re}(XY) = \operatorname{Re}(YX)$.
 - (iii) Re (CX) = 0 for all X implies that C = 0.
- (iv) CX = XC for all X iff C is real. In this case, $C = (c_1, 0)$, where $c_1 = \text{real}$, and $CX = (c_1q_1, c_1q_2) = XC$.
- (5) The conjugate of $X \equiv (q_1, q_2)$ is $X^* = (q_1^*, -q_2)$.
 - (i) $(X+Y)^* = X^* + Y^*$,
 - (ii) $(XY)^* = Y^*X^*$.
 - (iii) $X^* = X$ iff X is real.
- (6) The *norm* of X is the non-negative real number $N(X) \equiv XX^*$, which is also equal to X^*X . The *length* of X is the non-negative real number $|X| \equiv N(X)^{1/2} = (XX^*)^{1/2}$.
 - (i) N(X) = 0 iff X = 0.
 - (ii) If $X \neq 0$, then $X^{-1} \equiv X^*/N(X)$ is a right and left inverse of X.
- (iii) N(XY) = N(X)N(Y). It follows from this that XY = 0 iff X = 0 or Y = 0.
- (7) Though multiplication is generally non-associative,
 - (i) $(XY)Y^* = X(YY^*).$
 - (ii) If $Y \neq 0$, then $(XY)Y^{-1} = X = Y^{-1}(YX)$.
 - (iii) Re((XY)W) = Re(X(YW)).

APPENDIX 2. THE HOPF FIBERING AND MUTUALLY ISOCLINIC PLANES

At the beginning of § 4, we described how H. Hopf obtained his fibering of S^{2n-1} by S^{n-1} over S^n , n=2,4, or 8, by intersecting the unit sphere S^{2n-1} in $R^{2n}=Q_n\times Q_n$ with the Q_n -lines Y=CX and X=0. In Theorem 5.2, we proved that the Hopf fibering and maximal set of mutually isoclinic n-planes in R^{2n} are equivalent concepts. Here we prove, directly, the

THEOREM A2.1. The set of Q_n -lines $\{Y = CX, X = 0\}$ in $Q_n \times Q_n$, when viewed as n-planes in \mathbb{R}^{2n} , are mutually isoclinic n-planes.

Proof. We shall prove the theorem for the case n = 8 only. The proof for the cases n = 2, 4 follows the same line and is simpler.

Some preliminaries are necessary. Suppose that under the identification of $Q_8 \times Q_8$ with R^{16} as in Theorem 5.1, the elements (X, Y), (X', Y') of $Q_8 \times Q_8$ become the vectors (X, Y), (X', Y') in R^{16} with respectively the components $(x_1, ..., x_{16})$, $(x'_1, ..., x'_{16})$. Then it can easily be verified that the inner product of the two vectors (X, Y) and (X', Y') is

$$\langle (X, Y), (X', Y') \rangle \equiv \sum_{i=1}^{16} x_i x'_i = \text{Re} (XX'^* + YY'^*).$$

It follows from this that the length of the vector (X, Y) is

$$|(X, Y)| = \langle (X, Y), (X, Y) \rangle^{1/2} = (XX^* + YY^*)^{1/2},$$

and that the two vectors (X, Y) and (X', Y') are orthogonal if and only if $\text{Re}(XX'^* + YY'^*) = 0$.

We can now prove our theorem by showing that in R^{16} , the 8-plane A: Y = AX is isoclinic with the 8-planes B: Y = BX and $O^{\perp}: X = 0$.

Let $(T, BT) \in \mathbf{B}$ be the projection of any nonzero vector $(X, AX) \in \mathbf{A}$ on \mathbf{B} . Then the vector (X - T, AX - BT) is orthogonal to \mathbf{B} , i.e., it is orthogonal to all the vectors $(W, BW) \in \mathbf{B}$, where W is an arbitrary Cayley number. Therefore,

(A.1) Re
$$\{(X-T)W^* + (AX-BT)(BW)^*\} = 0$$
 for all $W \in Q_8$.

Since, by (4) (ii) and (7) (iii) in Appendix 1, the terms inside the brackets in Re $\{ \}$ are commutative and associative, the left-hand side of (A.1) is equal to

Re
$$\{(X-T)W^* + [(AX-BT)W^*]B^*\}$$

= Re $\{(X-T)W^* + [B^*(AX-BT)]W^*\}$
= Re $\{(X-T)W^* + [(B^*A)X - (B^*B)T]W^*\}$
= Re $\{[X-T+(B^*A)X-(B^*B)T]W^*\}$.

Therefore, by (4) (iii) in Appendix 1, condition (A.1) implies that

$$X - T + (B*A)X - (B*B)T = 0$$
,

and hence

(A.2)
$$T = (1 + B^*A)X/(1 + B^*B).$$

Now, the squared length of the vector (X, AX) is

$$|(X, AX)|^2 = XX^* + (AX)(AX)^*$$

= $XX^* + AA^*XX^*$,

i.e.,

(A.3)
$$|(X, AX)|^2 = (1 + A^*A)XX^*.$$

Similarly,

$$|(T, BT)|^2 = (1 + B*B)TT*.$$

But by (A.2),

$$TT^* = (1 + B^*A)X[(1 + B^*A)X]^*/(1 + B^*B)^2$$
$$= (1 + B^*A)(1 + A^*B)XX^*/(1 + B^*B)^2.$$

Therefore,

(A.4)
$$|(T, BT)|^2 = (1 + B^*A) (1 + A^*B)XX^*/(1 + B^*B) .$$

Hence, it follows from (A.3) and (A.4) that the angle θ between the vector $(X, AX) \in \mathbf{A}$ and its projection on **B** is given by

$$\cos^2\theta = \frac{|(T, BT)|^2}{|(X, AX)|^2} = \frac{(1 + A^*B)(1 + B^*A)}{(1 + A^*A)(1 + B^*B)},$$

which shows that the angle between any nonzero vector $(X, AX) \in \mathbf{A}$ and its projection on **B** is independent of the choice of X; that is, the 8-plane **A** is isoclinic with the 8-plane **B**.

Finally, to show that the 8-plane A: Y = AX is isoclinic with the 8-plane $O^{\perp}: X = 0$, we need only observe that the projection of the nonzero vector $(X, AX) \in A$ on O^{\perp} is the vector (O, AX), and

$$\frac{|(O, AX)|^2}{|(X, AX)|^2} = \frac{(AX)(AX)^*}{(1+A^*A)XX^*} = \frac{AA^*}{1+AA^*}$$

is independent of X.
