computed; they turn out to be isomorphic to  $\pi_s(U)$  and  $\pi_s(O)$  respectively. Moreover a product is defined in the direct sum of the  $E_s^U(E_s^O)$  turning it into a graded ring  $E_*^U(E_*^O)$ . The claim of Theorem A is proved in Section 3; we show that the maps  $\phi: E_s^U \to \pi_s(U)$ ,  $\psi: E_s^O \to \pi_s(O)$  given by the  $f_s$  of 0.1 are isomorphisms. Using the product structure in  $\pi_*(U)$  and  $\pi_*(O)$  known from K-theory the proof reduces to simple verifications in low dimensions. The symplectic case is dealt with in Section 4. In Section 5 we make a remark concerning the "linearization phenomenon" for the homotopy groups of U, O and Sp.

# 1. The groups $G_s$ and their representations

- We will denote throughout by  $G_s$  the group given by the presentation  $G_s = \langle \varepsilon, a_1, ..., a_s | \varepsilon^2 = 1, a_j^2 = \varepsilon, a_j a_k = \varepsilon a_k a_j, j, k = 1, 2, ..., s, j \neq k \rangle$ . Clearly any set  $A_1, ..., A_s$  of HR-matrices yields a (unitary or orthogonal) representation of  $G_s$  of degree n by  $\varepsilon \mapsto -E$ ,  $a_j \mapsto A_j$ , j = 1, 2, ..., s. Conversely a representation of  $G_s$  with  $\varepsilon \mapsto -E$ , in short an  $\varepsilon$ -representation, yields a set of s HR-matrices. For the elementary properties of  $G_s$  and its representations we refer to [E]. We just recall that the order of  $G_s$ is  $2^{s+1}$ , that  $\varepsilon$  is central, and that the irreducible unitary  $\varepsilon$ -representations of  $G_s$  are of degree  $2^{s/2}$  if s is even (one equivalence class), of degree  $2^{(s-1)/2}$  if s is odd (two equivalence classes). These degrees are the minimal values  $n_0$  in case U. As for the case O, one has to recall that a representation is equivalent to an orthogonal one if and only if it is equivalent to a real (and orthogonal) one. Thus, unless an irreducible unitary e-representation is already real, one has to add its conjugate-complex representation, and the discussion of the various cases depending on s yields the minimal values  $n_0$  (case O) mentioned in the introduction; in other words, the degrees
- 1.2. A very simple and useful scheme for studying the groups  $G_s$  and their  $\varepsilon$ -representations (and many other things) has been deviced by T. Y. Lam and T. Smith [LS]. They have expressed the  $G_s$  as products of very small and well-known groups. Namely  $C = G_1$ , the cyclic group of order 4;  $Q = G_2$ , the quaternionic group of order 8; K, the Klein 4-group; and D, the dihedral group of order 8. Although K and D do not belong to the family  $G_s$ , they are of a similar nature and contain a distinguished central element  $\varepsilon$  of order 2 (distinguished arbitrarily in K). "Product" here means the central product obtained from the direct product by identifying the

of the irreducible orthogonal  $\varepsilon$ -representations of  $G_{\varepsilon}$ .

two  $\varepsilon$ 's. The expression for the  $G_s$  then is as follows, displaying a fundamental periodicity modulo 8:

(2) 
$$s \mid 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9 \mid ...$$

$$G_s \mid \mathbb{Z}/2 \quad C \quad Q \quad QK \quad QD \quad D^2C \quad D^3 \quad D^3K \quad D^4 \quad D^4C \quad ...$$
and  $G_{s+8} = D^4G_s$ .

The tensor product of  $\varepsilon$ -representations of two of the groups  $G_s$ , K, D is an  $\varepsilon$ -representation of their product above, and all  $\varepsilon$ -representations of the  $G_s$  can be obtained in that explicit way from those of C, Q, K, D, which are well-known. This yields, in particular, the characters  $\chi$  and the Schur indices I of the irreducible unitary  $\varepsilon$ -representation (the Schur index I=1 if the representation is equivalent to a real one; if it is not, I=-1 if it is equivalent to the conjugate-complex one, I=0 otherwise). Both  $\chi$  and I behave multiplicatively with respect to the central product.

1.3. The Schur indices of the irreducible  $\varepsilon$ -representations are: 0 for  $C=G_1$ , -1 for  $Q=G_2$ , and 1 for K and D (two equivalence classes for K, one for D). This yields the Schur indices  $I_s$  of the irreducible  $\varepsilon$ -representations of the  $G_s$ , as listed in (2) below; we further list the numbers  $v_s^U$  of inequivalent unitary, and  $v_s^O$  of inequivalent orthogonal irreducible  $\varepsilon$ -representations, and the respective degrees  $d_s^U$ ,  $d_s^O$ . Note that  $I_s$  is periodic with period 8, and  $d_s^O$  is periodic with period 8 in the sense that  $d_{s+8}^O=16d_s^O$ . Finally we include in the same table the Grothendieck groups  $D_s^U$  and  $D_s^O$  of (equivalence classes of) irreducible  $\varepsilon$ -representations of  $G_s$ , with respect to the direct sum of representations.

(3)	S	0	1	2	3	4	5	6	7	8	9	•••
	$I_s$	1	0	- 1	-1	-1	0	1	1	1	0	
	$v_s^U$	1	2	1	2	1	2	1	2	1	2	
	$v_s^O$	1	1	1	2	1	1	1	2	1	1	
	$d_s^U$	1	1	2	2	4	4	8	8	16	16	
	$d_s^O$	1	2	4	4	8	8	8	8	16	32	
	$D_s^U$	Z	$\mathbf{Z} \oplus \mathbf{Z}$	Z	$\mathbf{Z} \oplus \mathbf{Z}$	Z	$\mathbf{Z} \oplus \mathbf{Z}$	Z	$\mathbf{Z} \oplus \mathbf{Z}$	Z	$\mathbf{Z} \oplus \mathbf{Z}$	
	$D_s^O$	Z	Z	Z	$\mathbf{Z} \oplus \mathbf{Z}$	Z	${f Z}$	$\mathbf{Z}$	$\mathbf{Z}\oplus\mathbf{Z}$	Z	Z	

The values of  $d_s^O$  follow immediately from the  $I_s$  and the  $d_s^U$ . The values  $n_0$  for the case O, as given in the Introduction, are the  $d_s^O$ .

## 2. The reduced ε-representation ring

2.1. For all  $s \ge 0$  the group  $G_s$  is the subgroup of  $G_{s+1}$  obtained by omitting the generator  $a_{s+1}$ ; let  $h_s: G_s \to G_{s+1}$  be the embedding homomorphism. Via  $h_s$  we can restrict an  $\varepsilon$ -representation of  $G_{s+1}$  to  $G_s$ , which in terms of HR-matrices means omitting  $A_{s+1}$ .

Let  $h_s^*: D_{s+1}^U \to D_s^U$  be the corresponding homomorphism of Grothendieck groups, and  $E_s^U = D_s^U/h_s^*D_{s+1}^U$  the "reduced" groups; similarly  $E_s^O = D_s^O/h_s^*D_{s+1}^O$ . They can easily be computed by means of the characters of  $\varepsilon$ -representations, as follows.

For Q and D the character of an irreducible unitary  $\varepsilon$ -representation is 0 except on 1 and  $\varepsilon$ . For C and K it is  $\neq 0$  on all 4 elements; on the essential generator  $(\neq \varepsilon)$  of C it is +i or -i for the two inequivalent representations, and +1 or -1 in the case of K. For  $G_s$ , s even, we infer from the table (2) that the character is 0 except on 1,  $\varepsilon$ . For  $G_s$ , s odd, the character is 0 except on 1,  $\varepsilon$  and two further elements z,  $\varepsilon z$ ; on these the two inequivalent  $\varepsilon$ -representations differ just by the sign of the character.

If s is even,  $d_{s+1}^U = d_s^U = 2^{s/2}$ ; thus the restriction of an irreducible  $\varepsilon$ -representation must be irreducible, whence  $h_s^* D_{s+1}^U = D_s^U$ ,  $E_s^U = 0$ . If s is odd,  $d_{s+1}^U = 2d_s^U = 2^{(s+1)/2}$ ; thus the restriction is the sum of two irreducible  $\varepsilon$ -representations, and since the character is 0 (except on 1,  $\varepsilon$ ) these two must be inequivalent. Therefore  $h_s^* D_{s+1}^U$  is the "diagonal" of  $D_s^U = \mathbf{Z} \oplus \mathbf{Z}$ , and  $E_s^U = \mathbf{Z}$ ; its generator  $\rho_s$  is represented by either of the two inequivalent irreducible  $\varepsilon$ -representations of  $G_s$ ,  $-\rho_s$  by the other one.

In the orthogonal case the  $E_s^O$  are computed similarly from (3). Since  $d_1^O = 2$  and  $d_0^O = 1$ , the restriction from  $D_1^O$  to  $D_0^O$  yields twice the generator, and  $E_0^O = \mathbb{Z}/2$ ; the same argument holds for  $s \equiv 0 \mod 8$ ,  $d_{s+1}^O = 2d_s^O$ . Since  $d_2^O = 4$  and  $d_1^O = 2$ , we get  $E_1^O = \mathbb{Z}/2$ . From  $d_3^O = d_2^O = 4$  we get  $E_2^O = 0$ . As for s = 3, the character argument shows that  $h_3^*D_4^O = \text{diagonal of } D_3^O (=\mathbb{Z} \oplus \mathbb{Z})$ , and  $E_3^O = \mathbb{Z}$ . For s = 4, 5, 6 the dimensions  $d_{s+1}^O = d_s^O$  show that  $d_s^O = d_s^O = 0$ . For  $d_s^O = 0$  show that  $d_s^O = d_s^O = 0$ . For  $d_s^O = 0$  show that  $d_s^O = d_s^O = 0$ . For  $d_s^O = 0$  show that  $d_s^O = d_s^O = 0$ . For  $d_s^O = 0$  show that  $d_s^O = d_s^O = 0$  show that  $d_s^O = d_s^O = 0$ . Finally one has, for all  $d_s^O = d_s^O = 0$ .
