respectively. Denote by \hat{t}_0 the largest value of t for which the curve Γ has a simple spherical inflection in U_0 . Denote by \hat{t}_1 the smallest value of t for which the curve Γ has a simple spherical inflection in U_1 . We proved that between $\Gamma(\hat{t}_0)$ and $\Gamma(\hat{t}_1)$ there is at least one vertex of Γ of odd order. We can join Γ to γ by a homotopy γ_s such that at each $s \in [0, 1)$ the curve γ_s has only simple spherical inflections. Thus each γ_s will have at least one vertex of odd order. This implies that γ will also have at least one vertex of odd order. This proves Proposition 4. \square
