Corollary 8.10 is purely arithmetical in nature. It should be possible to give a direct proof, but this probably requires a more ad hoc approach, making for instance a case distinction between the supersingular and the ordinary primes for E over K .

The next corollary is certainly well-known, but it is amusing to see how it can be proved using Arakelov theory.

COROLLARY 8.11. *Suppose that $N = p$ is a prime number. Extend the p -torsion points of E over the regular minimal model of E over K . Then the p -torsion points restrict injectively to a fiber at a prime of characteristic different from p .*

Proof. By symmetry considerations, it suffices to prove that for any p -torsion point P , the sections P and O do not intersect at a fiber above a prime of characteristic different from p . But if we take $N = p$ in the formula from Corollary 8.10, the right hand side is a rational multiple of $\log p$, hence so is the left hand side. As the local intersections involved in $(P, O)_{\text{fin}}$ are always non-negative, they are in fact zero at primes of characteristic different from p . This proves the corollary. \square

ACKNOWLEDGEMENTS. The author wishes to thank Gerard van der Geer for his encouragement and helpful remarks. Also he thanks Professor Qing Liu and the referee for their comments on an earlier version of this paper.
