Fourth order magnetic moment of the electron

by **A. Petermann.**

CERN. Theoretical Study Division. Institute for theoretical Physics. Copenhagen.

(17. VIII. 1957.)

In connection with the upper and lower bounds analysis done by the author[1]), which indicated a clear discrepancy with the Karplus and Kroll's result for the 4th order magnetic moment[2]), we have performed an analytic evaluation of the five independent diagrams contributing to this moment in fourth order*). The results are the following:

$$\mu_{\mathrm{I}} = \frac{\alpha^2}{\pi^2}\left(\frac{1}{6} + \frac{13}{36}\pi^2 + \frac{5}{4}\zeta(3) - \frac{5}{6}\pi^2 \operatorname{Log} 2\right) = -0.467\,\frac{\alpha^2}{\pi^2}. \tag{1}$$

$$\mu_{\mathrm{II_a}} = \frac{\alpha^2}{\pi^2}\left(\frac{11}{48} + \frac{\pi^2}{18}\right) = 0.778\,\frac{\alpha^2}{\pi^2}. \tag{2}$$

$$\mu_{\mathrm{II_c}} = \frac{\alpha^2}{\pi^2}\left(-\frac{67}{24} + \frac{\pi^2}{18} - \frac{1}{2}\zeta(3) + \frac{1}{3}\pi^2 \operatorname{Log} 2 - \frac{1}{2}\operatorname{Log}\frac{\lambda^2}{m^2}\right) = -0.564\,\frac{\alpha^2}{\pi^2} - \frac{1}{2}\,\frac{\alpha^2}{\pi^2}\operatorname{Log}\frac{\lambda^2}{m^2}. \tag{3}$$

$$\mu_{\mathrm{II_d}} = \frac{\alpha^2}{\pi^2}\left(\frac{11}{24} - \frac{\pi^2}{18} + \frac{1}{2}\operatorname{Log}\frac{\lambda^2}{m^2}\right) = -0.090\,\frac{\alpha^2}{\pi^2} + \frac{1}{2}\,\frac{\alpha^2}{\pi^2}\operatorname{Log}\frac{\lambda^2}{m^2}. \tag{4}$$

$$\mu_{\mathrm{II_e}} = \frac{\alpha^2}{\pi^2}\left(\frac{119}{36} - \frac{\pi^2}{3}\right) = 0.016\,\frac{\alpha^2}{\pi^2}. \tag{5}$$

$$\mu^{(4)}_{\mathrm{total}} = \frac{\alpha^2}{\pi^2}\left(\frac{197}{144} + \frac{\pi^2}{12} + \frac{3}{4}\zeta(3) - \frac{1}{2}\pi^2 \operatorname{Log} 2\right) = -0.328\,\frac{\alpha^2}{\pi^2}. \tag{6}$$

Compared with the values given in their original paper by KARPLUS and KROLL, one can see that two terms were in error: μ_{I} differs by

$$\frac{\alpha^2}{\pi^2}\,\frac{1}{32} = 0.031\,\frac{\alpha^2}{\pi^2};$$

$\mu_{\mathrm{II_c}}$ by $\dfrac{\alpha^2}{\pi^2}\left(\dfrac{32}{3} - \dfrac{61}{8}\pi^2 + \dfrac{17}{2}\pi^2 \operatorname{Log} 2 - \dfrac{109}{4}\zeta(3)\right) = 2.614\,\dfrac{\alpha^2}{\pi^2}$.

The three other terms check. The error in μ_{I} remained of course undetected in the upper and lower bound analysis owing to its small-

*) The terminology of ref. 2 is used throughout this paper.

ness. But the large discrepancy in μ_{II_c} was that pin-pointed out in the previous paper.

A summary of the most important electromagnetic observables, the theoretical values of which are modified by the new value of the magnetic moment, is now given:

Moment of the electron: $\frac{\mu_e}{\mu_0} = 1.0011596 = 1 + \frac{\alpha}{2\pi} - 0.328\,\frac{\alpha^2}{\pi^2}$.

FRANKEN and LIEBES' value for it: $\mu_e/\mu_0 = 1.001167 \pm 0.000005$*).

g-factor of the μ-meson (electromagnetic):

$$2\,(1.0011654) = 2\left(1 + \frac{\alpha}{2\pi} + 0.75\,\frac{\alpha^2}{\pi^2}\right).$$

Last Lederman's value: $2\,(1.0021 \pm 0.0008)$ *).

$2^2 S_{1/2} - 2^2 P_{1/2}$ (Hydrogen): (1057.94 ± 0.15) Mc/s; observed: $(1057{\cdot}77 \pm 0.10)$ Mc/s.

$2^2 S_{1/2} - 2^2 P_{1/2}$ (Deuterium): (1059.22 ± 0.15) Mc/s; observed: (1059.00 ± 0.10) Mc/s.

Fine structure constant: $1/\alpha = 137.0384$; (previously: 137.0365).

The new fourth order correction given here is in agreement with:

a) The upper and lower bounds given by the author[1]).

b) A calculation using a different method, performed by C. SOMMERFIELD[3]).

c) A recalculation done by N. M. KROLL and collaborators*).

The author thanks Prof. NIELS BOHR for the hospitality at the Institute.
