*On the occasion of the Brussels Universal
and International Exhibition 1958*

THE SWISS TEXTILE AND CLOTHING INDUSTRIES

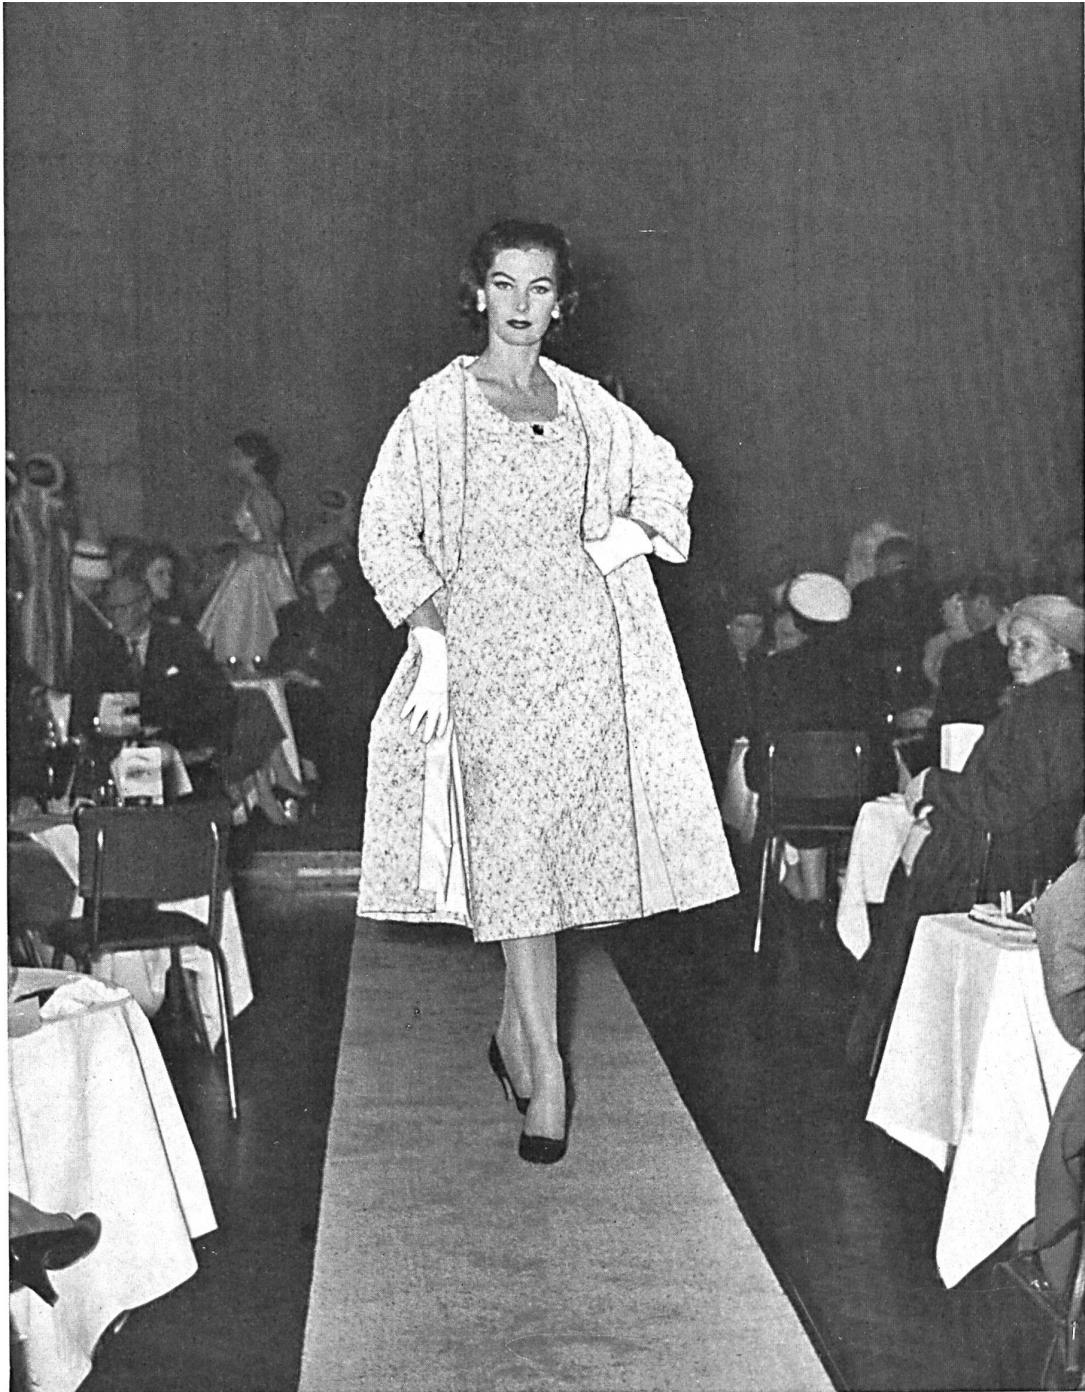

Although a periodical like Textiles Suisses — whose main purpose is to keep its readers informed of the novelties of which fashion is made — cannot continually refer to the structure of the industry itself, there are nevertheless occasions when it is interesting to call attention to the general set-up of Swiss textile production.

Switzerland's participation in the Brussels Universal and International Exhibition presents an ideal opportunity for casting a glance round all those activities which, although perhaps unfamiliar to our readers, are nevertheless essential to the making of the lovely creations they know and admire so much. In the following pages therefore, we are giving a general survey of all the branches in question, according to their relative importance rather than the extent of their participation in the Universal Exhibition.

We are sure that regular readers as well as those who will be making the acquaintance of our periodical for the first time at the Brussels Fair will appreciate this objective, concise and up-to-date account of Switzerland's textile industry which — we sincerely hope — will not only be of interest to them but also perhaps come in useful when next they visit Switzerland.

No other Swiss industry is so rich in contrasts as the various branches of textile production. For the most part they are activities that have evolved from work carried out by the family in the home in order to satisfy man's basic need to clothe himself. Swiss textile products have nevertheless risen above this purely utilitarian level to become articles of fashion. They therefore offer the paradox of being a type of production determined to a large extent by the decisions of international fashion circles, but nevertheless carried out in the main by small concerns in rural districts with the help of workers whose rustic character in no way detracts from the quality of the workmanship. Another paradox is presented by the fact that these factories, which are often old in origin and modest in appearance, are equipped with the very latest machinery and are run on the most

up-to-date rational lines permitted by the very original nature of the production, which concentrates on the manufacture of small quantities of high quality articles, with the main emphasis on the part played by the designer and manpower, and which makes a point of renewing its models each season and adapting itself immediately to changes in fashion and even of foreseeing them. Attention should also be called to the influence exerted by other countries on Swiss textile industries, either by refugees — from the 16th century up to the present day — or otherwise.

The silk industry has existed in its present form in Switzerland since the 17th century; it covers all stages of manufacture and includes work with artificial fibres (rayon) and synthetic fibres (nylon and similar products).

In the field of spinning, we find throwing, twisting and the manufacture of sewing threads.

Weaving is unquestionably the most important of the textile activities. It has developed mainly in the neighbourhood of the town of Zurich, which is itself the centre of the silk trade and the exportation of fabrics. The annual output of fabrics, two-thirds of which is regularly exported, is estimated at 150 million Swiss francs' worth. The nature of this production, its geographic situation and the high wages it has to pay prevent it from offering competitive prices on world markets. Like other Swiss textile branches, it must therefore concentrate on the manufacture of high quality, exclusive novelties in silk, rayon and synthetic fibres for Parisian haute couture and all the big international fashion centres. Tie-silks enjoy a very good reputation. The handweaving of silk bolting cloth is another important feature of the silk industry. These industrial fabrics, used in milling, are also required today for the manufacture of the silk screens used in textile printing (screen printing) and in the graphic arts (silk screen printing). Almost the whole of the annual output valued at between 9 and 10 million Swiss francs is exported.

Silk ribbons have been manufactured for over 400 years in the countryside around Basle, which is the commercial centre of this activity. The bulk of the output is exported to more than seventy countries in all parts of the world. This industry, whose products are of outstanding quality and always in keeping with the latest fashion trends, still plays an important part in the international market. Swiss ribbons are used in all branches of clothing: couture, ready-to-wear, lingerie, corsetry and millinery, and new uses are continually being found for them, in particular in packaging.

Basle is also Switzerland's shappe (silk waste) spinning centre. This industry has greatly developed its manufacture of fancy yarns in different fibres required for the making of special weaving effects.

The progress of science and the increasing world demand are responsible for the rapid development of the artificial and synthetic fibres industry. The manufacture of viscose rayon started in Switzerland in 1906 and has since developed considerably. The output of Swiss rayon factories is used in weaving, the manufacture of ribbons, the knitwear and jersey industries and for technical purposes (tyre cords); in addition to mat and shiny yarns, it includes various special fibres (hollow, vat-dyed, etc.) as well as artificial straws for the millinery braid industry. Rayon is also the basic material used in the manufacture of staple fibre (rayon fibres, cut to size and spun like natural cotton or wool fibres). Since 1956, synthetic fibres too have been made in Switzerland, either under license from foreign patents or according to original processes. Swiss industry

has moreover played an important part in the development of the use of these fibres by creating a process, since adopted in numerous countries, for the transformation of ordinary continuous yarns into the so-called stretch yarns. Whereas in 1920 the total output of artificial fibres amounted to only 600 metric tons, it exceeded 25 000 tons in 1957 (synthetic fibres included), some 70 % of this amount being exported. These industries employ more than 5000 workers.

Two centuries ago the cotton industry gradually began to oust the spinning and weaving of linen which had developed in the north-east of Switzerland. It expanded rapidly, especially after the introduction of machinery, and today it has become one of the country's major economic activities, providing employment for some 25 000 persons.

Cotton spinning and twisting is carried out on 1 200 000 and 350 000 spindles respectively, in a hundred or so mills situated in the cantons of St. Gall, Glaris and Zurich. Most of the output of yarns, estimated at a total annual value of several hundreds of millions of Swiss francs, is absorbed by weaving and embroidery concerns on the home market.

Cotton weaving is carried out in approximately a hundred concerns on some 20 000 mechanical looms. The average annual output is valued at over 500 million francs. The manufacturing programme covers a wide range. The standard qualities are sold mainly on the home market, while most of the fine fabrics are exported. These fine fabrics include plain, colour-woven, figured or printed materials, outstanding either for their high novelty, which makes them much sought after in the fashion industries, or for their wearing qualities (for example, colour fastness, waterproofing, etc.) which satisfy the most exacting demands. In addition to the classical fabrics there are now many new creations made possible by the progress achieved in weaving, dyeing, printing and finishing in general. Let us mention, among others, mousselines, batistes, voiles, organdies, poplins and gabardines as well as furnishing fabrics, marquisettes for curtaining, etc.

The popularity of these fabrics has made it possible to compensate in part for the big set-backs incurred in the embroidery industry during the 1930 slump. Another speciality of the fine cottons industry, the manufacture of colour-woven and especially printed handkerchiefs, was developed in the district of St. Gall at the time of the slump and has subsequently developed to a remarkable extent.

Embroidery was introduced into the canton of St. Gall on a commercial basis some two centuries ago. Today this industry is completely mechanised and women hand-embroiderers (canton of Appenzell) are employed only for accessory work such as monogramming and the hemming of handkerchiefs. The main centres of production, of which the town of St. Gall is the centre (cantons of St. Gall, Thurgau and Appenzell) contain

850 power looms and 800 hand looms. The Swiss embroidery industry has succeeded in surviving, in spite of wars and crises and in maintaining and increasing its reputation on foreign markets. The part it plays in Parisian haute couture is well known. The need to provide fashion designers with a constant flow of novelties compels manufacturers to be continually on the lookout for fresh ideas. Thus alongside the traditional types of white embroidery such as broderie anglaise, allover, braids, flounces, etc., there are new types such as imitation guipure, coloured embroideries, embroideries made of metal threads, straw and wool and embroideries of other kinds. Today, not only mousselines, voiles, batistes, organdies and other cotton fabrics are used as base materials but fabrics

The wool textile industry has developed enormously during the last twenty-five years and has considerably increased its output. Like other textile branches, it depends on other countries for its supplies of raw materials, Switzerland being able to meet only 3 % of the country's needs in raw wool.

The spinning and twisting of combed and carded wools are carried out on some 350 000 spindles, and Swiss spinning and twisting mills supply yarns for weaving and the knitwear and jersey industries as well as wools for handknitting.

Weaving is carried out on some 3300 looms. The manufacturing programme ranges from cloths and blankets to classical and fancy fabrics for men and women, in woollens and worsteds, in all fashionable designs and colours, including the finest specialities such as mousselines. Switzerland also possesses several carpet and felt factories.

Dating back to the Middle Ages, the linen industry is still flourishing in the cantons of Berne and Aargau where it is carried on in 30 factories employing some 3000 workers.

Switzerland's linen production consists mainly of high quality linens for household use : sheets, towels, tablecloths and classical and modern furnishing fabrics. The speciality that has made its name abroad however is the damask table linen for hotels, which is found in the best establishments all over the world.

The knitwear and jersey industry only really developed in the modern sense during

Cocktailkleid aus sehr feiner Spitze.

number were employed in making men's clothing. It should be pointed out here that the women's ready-to-wear industry has been meeting with great success on foreign markets for some time now. The dresses, suits, coats, skirts, blouses and other garments it makes are always inspired by the latest Paris fashions, adapted and toned down to suit the tastes of the very large clientele in different countries. Lastly, the materials used are of the best quality while the cut, sewing and finishing are always impeccable.

Knitted garments, whether classical articles such as sports sweaters or creations belonging more to the field of fashion, such as knitted or jersey dresses and suits, also

play an important part in the development of the clothing industry, but they have already been dealt with in the paragraph above devoted to the knitwear and jersey industry. The same applies to knitted underwear.

Woven lingerie manufacture (women's underwear, men's shirts, etc.) provide employment for some 7000 men and women (including cottage workers) in just under 150 concerns. Mention should also be made of 120 other concerns specialising in the making of ties, corsets, braces, gloves, hats and caps and employing some 3000 persons.

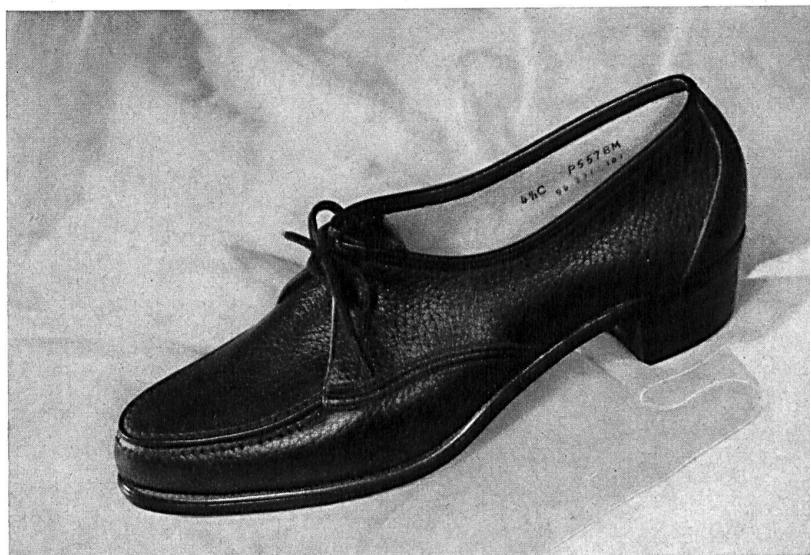

The typical features of the Swiss textile industry outlined at the beginning of this section also apply to the straw braid industry : production of articles that have to be renewed with each season's change of fashion, production concentrated in a rural district (canton of Aargau), destined mainly for export (as a general rule about 98 % of the total output). The fifteen concerns of this industry work only during the winter months and the 2000 to 2500 men and women workers it employs do agricultural work in the summer months. This unusual arrangement helps to ensure the stability of the labour force and to avoid economic crises. At present, use is no longer made of natural straw, but of all kinds of artificial materials, generally with a viscose base ; the products of this industry, which lead the field in the markets of the world owing to their great novelty, are used for the manufacture of hats, footwear, ladies' bags and other fashion articles.

A study of Switzerland's textile production would not be complete without some mention of the finishing concerns. The advances made in industrial chemistry and technology, during the last century and this, have enabled this industry to progress from the

simple processes of bleaching and dyeing to modern highly technical processes such as mercerisation, printing, flock-printing, waterproofing, impregnation and various other treatments making fabrics shrinkproof and crease-resistant and conferring on them numerous other qualities of wear and appearance that are remarkable for their permanence and resistance to washing.

The footwear industry, which is closely related to that of clothing, made its first appearance in Switzerland about the middle of the 19th century, when C.F. Bally founded the firm which still bears his name. Even before the turn of the century, other factories had been established so that today this industry numbers some 90 firms and 14 000 workers. The annual output varies between 10 and 12 million pairs of shoes, mostly made of leather. Exports have always played an important role in this branch and at present over one and a half million pairs are exported every year. In order to maintain their position on foreign markets, the bigger Swiss footwear factories devote special attention to questions of artistic creation and at the same time to good workmanship and comfort. Among the Swiss articles that are especially popular abroad, let us mention leather shoes and more particularly smart fashionable shoes for women and ski boots.

Tanning, which is one of the oldest industries in Switzerland, is continually coming up against strong foreign competition. It has however succeeded in bringing itself completely up to date and regaining the place it had temporarily lost. Today it uses processes which have all the advantages of the old time-honoured methods as well as the benefits of the latest technical progress. It caters mainly for the home market, but is also capable of exporting on a large scale.
