Thread cutting in the embroidery process?
Now directly on the embroidery machine!
Fully automatic and programmable.
With the revolutionary Pentacut thread
cutting device.
Naturally from Saurer

Embroidery Systems

When will you be at the cutting edge?

The Pentacut thread cutting device from Saurer gives the embroidery industry new ideas and promising future prospects.

The thread cutting devices well known from the multi-head embroidery machines were further developed by Saurer and adapted to the needs of the shuttle embroidery machines. The Pentacut thread cutting device opens up considerable possibilities for the embroiderer with regard to the production of patterns and the acquisition of new market segments.

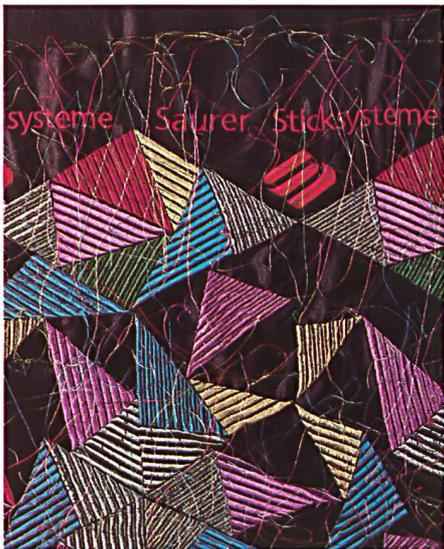

Less manual work, gentle yarn treatment

Because of the possibility of cutting all threads or individually selected threads on the needle and shuttle side, even complicated patterns can be embroidered easily and without additional manual work. Problems such as pulled threads due to the embroidery frame movement or frayed shuttle threads are a thing of the past.

Easier punching, more economical embroidering

The puncher's work is very demanding in the case of designs involving color and repeat changes. Thus, the hanging up of threads can lead to problems even in simple patterns. The necessary restriction of the movement between the selections (avoidance of excessively long embroidering with one color) often leads to difficulties in pattern production. With the introduction of thread cutting, these restrictions disappear completely. The individual colors can be completely embroidered in the pattern before a change is necessary.

Pentamat embroidery pattern without thread cutting.

Pentacut thread cutting device on the needle side.

Lower yarn consumption, higher productivity

As a result of the longer sections which can be embroidered with one color or in the same repeat, and the absence of hang-up stitches, the thread consumption is markedly reduced.

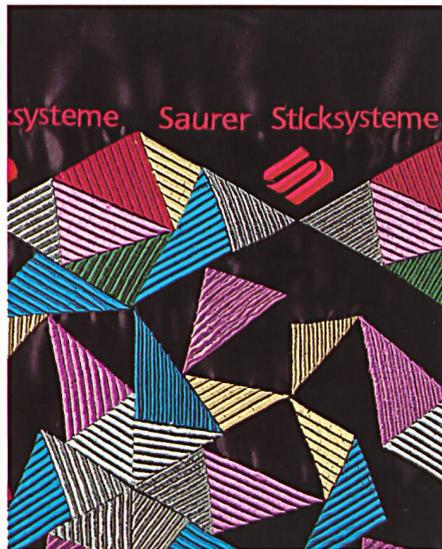

The number of embroidering position selections and the associated sewn-in stitches and starting stitches are also considerably reduced.

Owing to these two effects, the unproductive periods on the machine are substantially reduced and productivity is correspondingly increased.

No shearing process, shorter delivery times

Owing to the disappearance of the jump stitches, the shearing process necessary to date is completely dispensed with. This reduces the time between production and delivery of the embroidery to the customer and simplifies the handling of the order.

Pentamat embroidery pattern with thread cutting.

Pentacut thread cutting device on the shuttle side.

Higher machine user-friendliness, shorter down times

Cutting of all needle and shuttle threads before wind-up or roll-over is performed automatically by the machine, making manual intervention unnecessary. The thread separation in the region of the thread guide not only prevents mutual interference of adjacent threads but also permits simpler and faster threading. These two simplifications increase the user-friendliness of the machine and considerably reduce the unproductive times.

Extended range of application

So far, apart from fabric and felt, it has been possible to embroider only tulle as Raschel fabric on shuttle embroidery machines, since the shearing process subsequently required led to frequent defects in the more sensitive knitwear. This problem has now been solved by the use of the Pentacut thread cutting device. The possibility of embroidering knitwear economically and to a high quality may be regarded as an important extension of the application range of Saurer shuttle embroidery machines.
