Similarly we have

$$\widetilde{\text{wt}} \left(\begin{array}{c} a \uparrow \\ \bullet \\ b \uparrow \\ + \\ a \uparrow \\ b \uparrow \end{array} \right) = -1 \quad \text{and} \quad \widetilde{\text{wt}} \left(\begin{array}{c} a \uparrow \\ \bullet \\ a \uparrow \\ + \\ a \uparrow \\ a \uparrow \end{array} \right) = q^{1/2}.$$

We have a similar formula for a negative crossing.

Therefore we see that our graph invariant gives an R -matrix of the form

$$R_{ij}^{kl} = \begin{cases} q^{1/2} - q^{-1/2} & \text{if } i = k > j = l, \\ -1 & \text{if } i = l \neq j = k, \\ q^{1/2} & \text{if } i = j = k = l, \\ 0 & \text{otherwise;} \end{cases}$$

and

$$(R^{-1})_{ij}^{kl} = \begin{cases} -q^{1/2} + q^{-1/2} & \text{if } i = k < j = l, \\ -1 & \text{if } i = l \neq j = k, \\ q^{-1/2} & \text{if } i = j = k = l, \\ 0 & \text{otherwise;} \end{cases}$$

which coincides with $-R(q^{1/2})^{-1}$, where $R(q^{1/2})$ is the R -matrix given in [16], replacing q with $q^{1/2}$.

§5. INVARIANTS CORRESPONDING TO ANTI-SYMETRIC TENSORS

In this section, we will show briefly that our graph invariant gives the quantum link invariant each of its component equipped with an anti-symmetric tensor of the standard n -dimensional representation of $SU(n)$.

Let D be a link diagram each of its component colored with an integer i ($1 \leq i \leq n$). This corresponds to the i -fold anti-symmetric tensor of the standard representation of $SU(n)$.

Then $\langle D \rangle_n$ is defined by

$$\left\langle \begin{array}{c} i \uparrow \\ \text{crossing} \\ j \uparrow \end{array} \right\rangle_n = \sum_{k=0}^i (-1)^{k+(j+1)i} q^{(i-k)/2} \left\langle \begin{array}{c} i \uparrow \quad j+k-i \uparrow \quad j \uparrow \\ \text{diagram} \\ j+k \uparrow \quad i-k \uparrow \\ j \uparrow \quad k \uparrow \quad i \uparrow \end{array} \right\rangle_n, \quad \text{for } i \leq j$$

and

$$\left\langle \begin{array}{c} i \uparrow \\ \text{crossing} \\ j \uparrow \end{array} \right\rangle_n = \sum_{k=0}^j (-1)^{k+(i+1)j} q^{(j-k)/2} \left\langle \begin{array}{c} i \uparrow \quad i+k-j \uparrow \quad j \uparrow \\ \text{diagram} \\ j-k \uparrow \quad i+k \uparrow \\ j \uparrow \quad k \uparrow \quad i \uparrow \end{array} \right\rangle_n, \quad \text{for } i > j$$

For a negative crossing, replace q with q^{-1} .

Now we will show

THEOREM 5.1. *The quantity $\langle D \rangle_n$ with D a colored link diagram is invariant under the Reidemeister moves II and III. Thus it is a colored framed link invariant.*

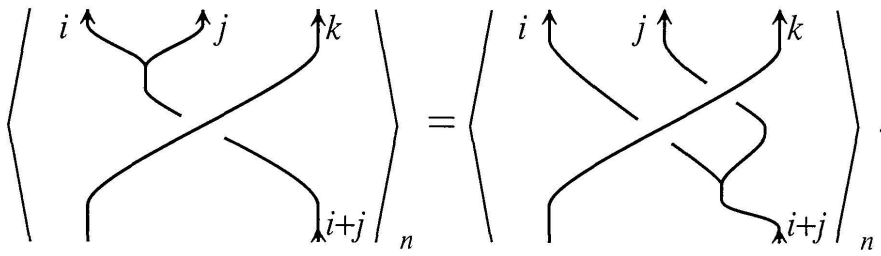

To prove the theorem above, we prepare some lemmas:

LEMMA 5.2.

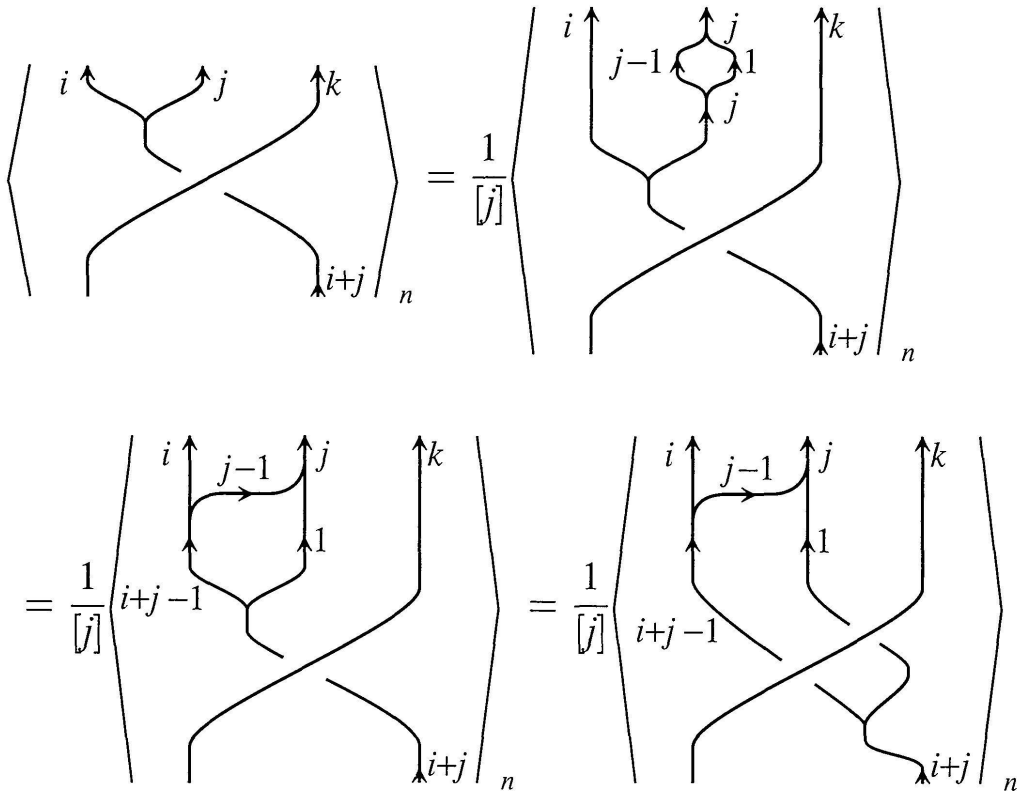

$$\left\langle \begin{array}{c} 1 \uparrow \quad i+1 \uparrow \quad i \uparrow \\ \text{diagram} \\ i \uparrow \quad 1 \uparrow \\ 1 \uparrow \quad i \uparrow \end{array} \right\rangle_n = [n - i - 1] \left\langle \begin{array}{c} 1 \uparrow \quad i \uparrow \\ \text{diagram} \\ 1 \uparrow \quad i \uparrow \end{array} \right\rangle_n + \left\langle \begin{array}{c} 1 \uparrow \\ \text{diagram} \\ i \uparrow \end{array} \right\rangle_n.$$

Proof. The proof of this lemma is similar to that of Lemma 2.4 and we leave it to the reader. \square

LEMMA 5.3.

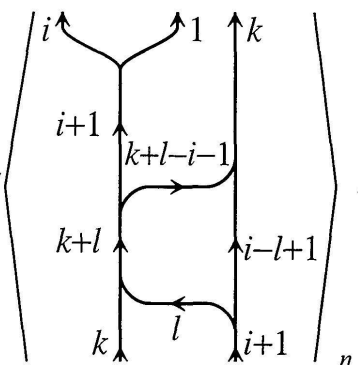

(5.1) 

Proof. It suffices to prove the case $i = 1$ or $j = 1$ since we have

and the conclusion follows from the case $i = 1$ or $j = 1$ and induction. Here we use Lemma A.1 in the first equality.

We only prove the case $j = 1$ and $i < k$ since the remaining case is similar. From the definition, the left hand side of (5.1) with $j = 1$ equals

$$\sum_{l=0}^{i+1} (-1)^{l+(k+1)(i+1)} q^{(i-l+1)/2} \cdot \text{Diagram}$$

The right hand side becomes

$$\sum_{l=0}^i (-1)^{l+(k+1)(i+1)} q^{(i-l+1)/2} \left[\text{Diagram 1} + \sum_{l=0}^i (-1)^{l+(k+1)i+k} q^{(i-l)/2} \text{Diagram 2} \right]$$

Sliding the bar colored with l using Lemma 2.6, the first diagram becomes

$$\begin{aligned} & \left[\text{Diagram 1} \right] = [i-l] \left[\text{Diagram 2} \right] + \left[\text{Diagram 3} \right] \\ & = [i-l] \left[\text{Diagram 4} \right] + \left[\text{Diagram 5} \right], \end{aligned}$$

where the first equality follows from Lemma A.7 below.

The second diagram turns out to be

$$\left(\text{Diagram 1} \right) = [i - l + 1] \left(\text{Diagram 2} \right) .$$

Therefore the right hand side of (5.1) becomes

$$\left\{ \sum_{l=0}^i (-1)^{l+(k+1)(i+1)} q^{(i-l+1)/2} [i - l] + \sum_{l=0}^i (-1)^{l+(k+1)i+k} q^{(i-l)/2} [i - l + 1] \right\}$$

$$\begin{aligned}
 & \times \left(\text{Diagram 1} \right) \\
 & + \sum_{l=0}^i (-1)^{l+(k+1)(i+1)} q^{(i-l+1)/2} \left(\text{Diagram 2} \right) \\
 & = \sum_{l=0}^i (-1)^{l+(k+1)(i+1)+1} \left(\text{Diagram 3} \right)
 \end{aligned}$$

It suffices to show the case $i = 1$ from Lemmas A.1 and 5.3 since

$$\begin{aligned}
 & \text{Diagram 1} = \frac{1}{[i]} \text{Diagram 2} = \frac{1}{[i]} \text{Diagram 3} \\
 & = \frac{1}{[i]} \text{Diagram 4} = \frac{1}{[i]} \text{Diagram 5} \\
 & = \langle i \uparrow \quad \uparrow j \rangle_n,
 \end{aligned}$$

where the second equality follows from Lemma 5.3 and the fourth by induction on i . Now we have

$$\begin{aligned}
 & \text{Diagram 1} \\
 & = \text{Diagram 2} - q^{1/2} \text{Diagram 3} - q^{-1/2} \text{Diagram 4} + \text{Diagram 5}
 \end{aligned}$$

$$\begin{aligned}
 &= \left\langle \begin{array}{c} 1 \uparrow \\ j \uparrow \\ 1 \uparrow \end{array} \begin{array}{c} j-1 \rightarrow \\ j \rightarrow \\ j-1 \leftarrow \\ j \leftarrow \end{array} \right\rangle_n + \left(-q^{1/2}[j] - q^{-1/2}[j] + [j+1] \right) \left\langle \begin{array}{c} 1 \uparrow \\ j+1 \uparrow \\ 1 \uparrow \end{array} \begin{array}{c} j \rightarrow \\ j \rightarrow \\ j \leftarrow \\ j \leftarrow \end{array} \right\rangle_n \\
 &= \left\langle \begin{array}{c} 1 \uparrow \\ j \uparrow \end{array} \right\rangle_n + \left([j-1] - q^{1/2}[j] - q^{-1/2}[j] + [j+1] \right) \left\langle \begin{array}{c} 1 \uparrow \\ j+1 \uparrow \\ 1 \uparrow \end{array} \begin{array}{c} j \rightarrow \\ j \rightarrow \\ j \leftarrow \\ j \leftarrow \end{array} \right\rangle_n \\
 &= \left\langle \begin{array}{c} 1 \uparrow \\ j \uparrow \end{array} \right\rangle_n,
 \end{aligned}$$

where we use Lemma A.4 in the third equality.

Next we will show

$$\left\langle \begin{array}{c} i \uparrow \\ j \downarrow \end{array} \right\rangle_n = \left\langle \begin{array}{c} i \uparrow \\ j \downarrow \end{array} \right\rangle_n.$$

It also suffices to show the case $i = 1$ as above. We have

$$\begin{aligned}
 &\left\langle \begin{array}{c} 1 \uparrow \\ j \downarrow \end{array} \right\rangle_n \\
 &= \left\langle \begin{array}{c} 1 \uparrow \\ j \downarrow \\ 1 \uparrow \\ j \downarrow \end{array} \right\rangle_n - q^{1/2} \left\langle \begin{array}{c} 1 \uparrow \\ j+1 \downarrow \\ j \downarrow \\ j-1 \downarrow \end{array} \right\rangle_n - q^{-1/2} \left\langle \begin{array}{c} 1 \uparrow \\ j-1 \downarrow \\ j \downarrow \\ j+1 \downarrow \end{array} \right\rangle_n + \left\langle \begin{array}{c} 1 \uparrow \\ j+1 \downarrow \\ j \downarrow \\ j+1 \downarrow \end{array} \right\rangle_n \\
 &= \left([n-j+1] - q^{1/2}[n-j] - q^{-1/2}[n-j] \right) \left\langle \begin{array}{c} 1 \uparrow \\ j-1 \downarrow \\ j \downarrow \end{array} \right\rangle_n + \left\langle \begin{array}{c} 1 \uparrow \\ j+1 \downarrow \\ j \downarrow \\ j+1 \downarrow \end{array} \right\rangle_n
 \end{aligned}$$
