THE WITT GROUP OF LAURENT POLYNOMIALS

by Manuel OJANGUREN and Ivan PANIN

ABSTRACT. We give a direct, self-contained proof of the fact that for a large class of rings A , in particular for all regular rings with involution, $W(A[t, 1/t]) = W(A) \oplus W(A)$.

1. INTRODUCTION

The purpose of this note is to give a short direct proof of two fundamental theorems on the Witt group of polynomials and Laurent extensions of a ring A . These theorems were proved independently by M. Karoubi [3] and by A. Ranicki [5]. We will state them under the most general conditions on A and for their proofs we will use nothing more than a general result on the K -theory of Laurent polynomials. In the last section we will show, by two counterexamples, that the assumptions we make on A are necessary.

We begin by recalling briefly some definitions. We refer to [4] for a more detailed exposition and for the proofs of the few basic results that we will use.

Let A be an associative ring with an involution denoted by $a \mapsto a^\circ$. Except in §2 we will always assume that 2 is invertible in A . If M is a right A -module, we denote by M^* its dual $\text{Hom}_A(M, A)$ endowed with the right action of A given by $fa(x) = a^\circ f(x)$ for any $f: M \rightarrow A$ and $a \in A$. If P is a finitely generated projective right A -module we identify it with P^{**} through the canonical isomorphism mapping $x \in P$ to $\hat{x}: P^* \rightarrow A$ defined by $\hat{x}(f) = f(x)$.

Let ϵ be 1 or -1 . An ϵ -hermitian space over A is a pair (P, α) consisting of a finitely generated projective right A -module P and an A -isomorphism $\alpha: P \rightarrow P^*$ satisfying $\alpha = \epsilon \alpha^*$. For brevity ϵ -hermitian spaces will be called *spaces*. A 1-hermitian space (over a commutative ring A) is also called a *quadratic space*.

Two spaces (P, α) and (Q, β) are *isometric* if there exists an A -isomorphism $\varphi: P \rightarrow Q$ such that the square

$$\begin{array}{ccc} P & \xrightarrow{\varphi} & Q \\ \alpha \downarrow & & \downarrow \beta \\ P^* & \xleftarrow{\varphi^*} & Q^* \end{array}$$

commutes. A space is *hyperbolic* if it is isometric to a space of the form

$$H(P) = \left(P \oplus P^*, \begin{pmatrix} 0 & 1 \\ \epsilon & 0 \end{pmatrix} \right).$$

The *orthogonal sum* of two spaces (P, α) and (Q, β) is the space

$$(P, \alpha) \perp (Q, \beta) = (P \oplus Q, \alpha \oplus \beta).$$

If (P, α) is a space and M a submodule of P we denote by M^\perp the orthogonal of M , defined by the exact sequence

$$0 \longrightarrow M^\perp \longrightarrow P \xrightarrow{i^* \circ \alpha} M^*,$$

where i^* is the dual of the inclusion $i: M \rightarrow P$. A submodule M of P is *totally isotropic* if $M \subseteq M^\perp$. A *sublagrangian* of a space (P, α) is a totally isotropic direct factor of P . A *lagrangian* of (P, α) is a sublagrangian L such that $L = L^\perp$. For instance, P and P^* are lagrangians of $H(P)$.

The Witt group $W(A)$ of ϵ -hermitian spaces over A is the quotient of the Grothendieck group of ϵ -hermitian spaces with respect to orthogonal sums, by the subgroup generated by all hyperbolic spaces. We say that two spaces are *Witt equivalent* if they represent the same element of $W(A)$.

Consider now the rings $A[t]$ and $A[t, t^{-1}]$, endowed with the involution that fixes t and maps $a \in A$ to a° . For the ring $A[t, t^{-1}]$ we introduce a variant $W'(A[t, t^{-1}])$ of the Witt group. We first consider the Grothendieck group Q of ϵ -hermitian spaces over $A[t, t^{-1}]$ which are extended from A as $A[t, t^{-1}]$ -modules, and its subgroup N generated by the hyperbolic spaces $H(P)$ where P is extended from A . We then define $W'(A[t, t^{-1}])$ as Q/N . Clearly $W'(A[t, t^{-1}])$ maps canonically to $W(A[t, t^{-1}])$. Here are our results.

A (THEOREM 3.1). *Let A be an associative ring with involution, in which 2 is invertible. The canonical homomorphism*

$$W(A) \rightarrow W(A[t])$$

is an isomorphism.

B (THEOREM 5.1). *Let A be an associative ring with involution, in which 2 is invertible. The homomorphism*

$$\psi: W(A) \oplus W(A) \rightarrow W'(A[t, t^{-1}])$$

mapping (ξ, η) to $\xi + t\eta$ is an isomorphism.

C (THEOREM 7.1). *Let A be an associative ring with involution, in which 2 is invertible. Let*

$$\varphi: W'(A[t, t^{-1}]) \rightarrow W(A[t, t^{-1}])$$

be the canonical homomorphism.

- (a) *If $H^2(\mathbf{Z}/2, K_{-1}(A)) = 0$, then φ is surjective.*
- (b) *If $K_0(A) = K_0(A[t]) = K_0(A[t, t^{-1}])$, then φ is an isomorphism.*

Two examples will be constructed in §8 to show that the assumptions in (a) and in (b) cannot be omitted.

An amusing application of **B** is the following result:

D (PROPOSITION 6.8). *Let A be a commutative semilocal ring in which 2 is invertible. Let (P, α) be a quadratic space over A . If (P, α) is isometric to $(P, t \cdot \alpha)$ over $A[t, t^{-1}]$, then (P, α) is hyperbolic.*

We remark that in general, even for a commutative local ring, there is no residue map

$$Res: W(A[t, t^{-1}]) \rightarrow W(A)$$

satisfying the following two properties:

- For any constant space $\xi \in W(A) \subset W(A[t, t^{-1}])$, $Res(\xi) = 0$.
- For any constant space $\xi \in W(A) \subset W(A[t, t^{-1}])$, $Res(t \cdot \xi) = \xi$.

In fact, the existence of such a residue map immediately implies the injectivity of

$$\varphi \circ \psi: W(A) \oplus W(A) \rightarrow W(A[t, t^{-1}]),$$

which may fail, as in Example 8.1. However, there exists a residue map $Res: W'(A[t, t^{-1}]) \rightarrow W(A)$ (Proposition 5.2) which yields the injectivity of ψ .

We now recall three elementary, well-known facts about hermitian spaces.

PROPOSITION 1.5. *Let (P, α) be any space. Then:*

1. *The space $(P, \alpha) \perp (P, -\alpha)$ is hyperbolic.*
2. *If L is a lagrangian of (P, α) , then (P, α) is isometric to $H(L)$.*
3. *If M is a sublagrangian of (P, α) , then the map α induces on M^\perp/M a natural structure of hermitian space that makes it Witt equivalent to (P, α) .*

2. *K*-THEORETIC PRELIMINARIES

We recall a few results proved in the twelfth chapter of Bass' book [1]. For any ring A we denote by $K_0(A)$ the Grothendieck group of finitely generated projective right A -modules and by $K_1(A)$ the abelianized general linear group of A : $K_1(A) = GL(A)/[GL(A), GL(A)]$. By Whitehead's lemma $K_1(A)$ is also the quotient of $GL(A)$ by the subgroup $E(A)$ generated by all elementary matrices over A .

For any functor F from rings to abelian groups we denote by $N_+F(A)$ the kernel of the map $F(A[t]) \rightarrow F(A)$ obtained by putting $t = 0$. Similarly, we denote by $N_-F(A)$ the kernel of $F(A[t^{-1}]) \rightarrow F(A)$ obtained by putting $t^{-1} = 0$. The inclusions of $A[t]$ and $A[t^{-1}]$ into $A[t, t^{-1}]$ define a map

$$N_+F(A) \oplus N_-F(A) \longrightarrow F(A[t, t^{-1}])$$

whose cokernel will be denoted by $LF(A)$. The functor LK_1 turns out to be naturally isomorphic to K_0 , hence we will denote LK_i by K_{i-1} for $i = 1$ and also for $i = 0$.

THEOREM 2.1. *Let A be any associative ring.*

(a) *For $i = 0$ or 1 there exists a natural embedding*

$$\lambda_i: K_{i-1}(A) \longrightarrow K_i(A[t, t^{-1}])$$

such that the composite

$$K_{i-1}(A) \xrightarrow{\lambda_i} K_i(A[t, t^{-1}]) \longrightarrow LK_i(A) = K_{i-1}(A)$$

is the identity.
